COUNTY OF HAWAI‘I PLANNING DEPARTMENT
BACKGROUND REPORT

CONNECTIONS NEW CENTURY PUBLIC CHARTER SCHOOL/CBESS
SPECIAL PERMIT APPLICATION NO. 12-000138 (SPP 12-000138)

CONNECTIONS NEW CENTURY PUBLIC CHARTER SCHOOL/CBESS has submitted an application for a Special Permit to develop a K to 12 charter school campus with dorm facilities and related uses on approximately 70 acres situated in the State Land Use Agricultural District. The property is located on the southwest and the northeast sides of Edita Street near its intersection with Ka‘ūmana Drive and adjoining the Pacific Plantation Subdivision in Ka‘ūmana, South Hilo, Hawai‘i, TMK: 2-5-006:141.

PROPOSED DEVELOPMENT

1. **Request**: The applicant has submitted a Special Permit application to develop a new academic campus, which will accommodate an elementary, intermediate, and high school and the common facilities that would support these programs. The applicant is proposing to build the development in several phases. The subject property is divided by Edita Street and includes what is referred to as the “lower parcel” and the “upper parcel”. All major school facilities will be located on the lower parcel. The following is a description of the proposed development:

- **Lower Parcel**: The major school facilities include the elementary, intermediate and high school classroom buildings, the administrative center, the library/resource center, the kitchen/dining facility, a gymnasium/multi-purpose building, green/shade houses, a 6-horse barn, a maintenance building, a 30-person dormitory, a caretaker’s residence, and a small facility to house the intergenerational program. These facilities would support a projected 167 elementary students, 107 intermediate students, 107 high school students (381 K through 12 students), and 25 intergenerational clients. The dormitory would serve a maximum of 30 students. The buildings will be single story in height. There will be two parking lots (main and secondary) with a total of 140 parking stalls.
Upper Parcel: There will be no major school facilities constructed on the upper parcel. A walkway is the only structure being proposed on the upper parcel, which will provide access and viewing opportunities within the 'ōhia forest. The walkway would be elevated on posts roughly 4 to 5 feet above grade. Connections intends to use this land area to support a future forestry/conservation program, which focuses on forest resource management and conservation, and forest ecosystem restoration.

2. **Phasing/Timetable:** The applicant is proposing to design and construct the project in 9 phases. The entire project is projected to be completed within 15 to 25 years. The different phases are described in detail on Page 12 of the Special Permit application.

3. **Days/Hours of Operation:** Weekday hours for the school and administration are from 7:00 a.m. to 5:30 p.m. More specifically, the elementary and intermediate instructional hours are from 7:30 a.m. to 2:00 p.m., Monday through Thursday, and from 7:30 a.m. to 1:00 p.m. on Friday. The high school's instructional hours are from 7:45 a.m. to 2:15 p.m., Monday through Thursday, and from 7:45 a.m. to 1:15 p.m. on Friday. There may be some limited extra-curricular activities, however, events such as dances and graduation would occur off-site. Weekend activities connected to the agricultural program may be conducted.

4. **Number of Employees:** Currently, Connections has a staff of 50 full-time and 17 part-time employees. Under a full development scenario, the school would maintain roughly the same number of employees.

5. **Reason and Objective for the Request:** The applicant's reason for the request is to consolidate their academic programs at a single location and provide facilities that support the goals and visions of the school. The objective of the request is to allow the applicant to continue its planning efforts to develop a new campus in Kaumana. Securing the Special Permit would facilitate fundraising efforts so that additional studies and planning/design work can continue. Additionally, approval of the Special Permit would allow the applicant to implement the initial phases of the school while they continue to work at resolving infrastructure and financial constraints.
6. **Land Ownership:** The landowner of the property is the State of Hawai‘i. In January 2011, the Board of Land and Natural Resources approved Connections’ request for a general lease of the property for school purposes. The lease enables the lessee to utilize the parcel for its school and apply for a Special Permit.

**STATE AND COUNTY PLANS**

7. **State Land Use District:** Agricultural.

8. **General Plan LUPAG MAP:** Low Density Urban (LDU).

9. **Zoning:** Agricultural 1-acre (A-1a).

10. **Chapter 343: Chapter 343, Hawaii Revised Statutes (HRS):** The proposed school is utilizing State land for the project, and are subject to the requirements of Chapter 343, Hawaii Revised Statutes, regarding Environmental Impact Statements. A Finding of No Significant Impact (FONSI) declaration was issued for the project by the Department of Land and Natural Resources (DLNR).

11. **State Land Use Commission:** Hawaii Revised Statutes Section 205-6 (d) states “Special permits for land the area of which is greater than fifteen acres or for lands designated as important agricultural lands shall be subject to approval by the land use commission. The land use commission may impose additional restrictions as may be necessary or appropriate in granting the approval, including the adherence to representations made by the applicant.”

12. **SMA:** The property is not situated within the Special Management Area (SMA). It is located over three miles from the nearest coastline.

**DESCRIPTION OF PROPERTY AND SURROUNDING AREAS**

13. **Subject Property:** The subject property is 70.15 acres in size and is irregular in shape. It is located approximately 2.5 miles above Hilo town and located on the southwest side and the northeast side of Edita Street, at its intersection with Kaūmana Drive. The property is split into two parcels by Edita Street. The upper parcel is roughly 33 acres and the lower parcel is 37 acres. The property is currently undeveloped and there are no existing uses or structures. The entire project site is situated on the 1880-1881 lava flow.
14. **Surrounding Zoning/Land Uses**: Surrounding lands to the south and west are similarly zoned A-1a. Further south are properties zoned A-20a and A-10a. To the north are properties zoned RS-10 and RS-15, with some properties zoned A-3a further north across Kaūmana Drive. There is a property zoned Open that adjoins the lower parcel to the northeast. Surrounding uses consist mainly of single-family residences and vacant lands, with some agricultural activity occurring in the area.

15. **U.S. Soil Survey**: Soils on the subject property are mainly comprised of pāhoehoe lava flow (rLW).

16. **ALISH System**: The property is unclassified on the State Department of Agriculture’s Agricultural Lands of Importance to the State of Hawaii (ALISH) Map.

17. **Land Study Bureau’s Detailed Land Classification System**: The soil within the subject property is classified as “D” or “Poor” for agricultural productivity.

18. **Archaeological Resources**: An archaeological assessment was conducted of the property in 2008 by Pacific Legacy, Inc. Research found little evidence of human activity in the project area during the pre-Contact period. The entire project area is situated on the 1880-1881 lava flow and as a result it is surmised that any pre-existing archaeological or historic sites within the project area would have been destroyed by the flow. During the field investigation, no archaeological sites were encountered and it appears that subsequent to the 1880-1881 flow, permanent human use of the area stopped. By letter dated August 17, 2010, Connections Public Charter School (through Wil Chee – Planning and Environmental) requested a “no-effect” letter from SHPD based on the findings of the archaeological assessment survey and field inspection of Kaūmana Cave. To date, no response has been received from SHPD.

19. **Kaumana Cave**: At the request of the State Historic Preservation Division (SHPD), a supplemental field inspection of Kaūmana Cave was also conducted by Pacific Legacy, Inc. An archaeological investigation was conducted of the accessible portion of Kaūmana Cave that underlies the upper parcel. One of the purposes of this inspection was to verify previous accounts of historic elements within the cave, which include pectoglyphs (names chipped into the cave’s walls) and electric insulators on the cave
walls. The portion of the cave that underlies the lower parcel was not inspected as it is believed to be inaccessible. The field inspection found an abundance of pecked names near the cave entrance at the county park. Deeper into the cave, the pecked names become more sporadic with occasional dense concentrations. The deepest concentration of names encountered were roughly 850 feet from the cave entrance, which would place the location directly beneath Ka'ūmana Drive, outside the project site. Beyond that point only two sets of pecked names were noted, both of which appear to be recent. In addition to the pecked names, numerous names have been spray painted onto the cave walls. No names appear to be older than 50 years were found in the cave segment that underlies the upper parcel. The field inspection also found no evidence of electrical insulators attached to the cave wall. The inspection report concluded that with the exception of the pecked names, no historic elements were encountered in the accessible portion of the Ka'ūmana Cave that underlies the project site. The applicant is proposing not to construct any major school facilities on the upper parcel and to maintain a minimum 100-foot buffer on either side of the case alignment to alleviate concerns about impacting the cave ecosystem.

20. **Flora/Fauna Resources:** A biological assessment of the property, which encompassed flora, vertebrates and invertebrates, was completed in 2008-2009. The assessment concluded that there is nothing unique about the project site or its vegetation, and that the construction and operation of the school would not adversely impact native avian or mammalian resources in the project site. The botanical survey of the property was undertaken on December 10 and 11, 2008. During the survey a total of 65 plant species were identified, 11 of which are classified as native, or occurring naturally, to the Hawaiian Islands. No protected plant species were recorded during the survey. Invertebrate, mammalian, and avian field surveys of the property were conducted between November 2008 and January 2009. During the surveys, a total of 20 invertebrate, 15 avian, and 1 mammalian species were documented to be present within the project site.

21. **Valued Cultural Resources:** There have been no identified traditional or customary native Hawaiian rights exercised at the property. This conclusion was based on several
archaeological surveys, archival research, oral interviews and the lack of claimants offering knowledge of such resources. However, if any traditional or cultural practices are identified, the applicant will make efforts to accommodate continuation of these practices.

22. **FIRM:** The subject property is located within Zone X, area determined to be outside the 500-year flood plain.

23. **Public Access:** There is no known public access to the mountains or the shoreline that runs through the property.

24. **Traffic Impacts:** A Traffic Impact Assessment Report (TIAR) was prepared during the environmental assessment process. Existing traffic volumes in the project area are low and there are no signalized intersections in the immediate vicinity of the property. The two primary circulation routes in the immediate vicinity of the project site are Kaumana Drive and Edita Street. The adjacent roadways currently operate at a level-of-service (LOS) grade A or B. This implies good operating conditions, minimal delays, and high levels of service. Based on the findings of the TIAR, the project is not expected to generate large increases in traffic volumes and would not result in adverse impacts to traffic and circulation patterns in the project area. The Police Department commented that although the section fronting the proposed site is wide with a paved shoulder, the section of Edita Street from Kaumana Drive leading to this site has no pavement off of the travel portion of the roadway. The shoulder in this area is grass/muddy and not desirable for pedestrian travel. This causes pedestrian traffic to walk on the roadway. If approved, there will be a substantial increase in pedestrian traffic as a result of this project. That, combined with the lack of sidewalks in this area, will make it unsafe for pedestrian traffic. The Department of Public Works commented that they are amenable to the TIAR’s recommendation of a separate recommendation of a separate left turn lane into the “lower campus” on Edita Street. The Department of Public Works-Traffic Division commented that the applicant submit a comprehensive traffic management plan.

PUBLIC UTILITIES AND SERVICES
25. **Road Access:** Access to the subject property is via Edita Street, which extends from Kaūmana Drive. Both Edita Street and Kaūmana Drive are County roads. Edita Street has a 60-foot right-of-way width, which includes a 48-foot pavement width fronting the project site. The paved area accommodates two travel lanes (20 feet), a 20-foot shoulder on the northeast side of the road, and an 8-foot shoulder on the southwest side. The road is in good condition.

26. **Water:** According to the Department of Water Supply, water is available for up to a maximum daily usage of 4,200 gallons per day from an existing 8-inch waterline on Kaūmana Drive for the upper campus and from an existing 8-inch waterline on Edita Street for the lower campus. The property is assigned seven (7) units of water, which equates to an average usage of 600 gallons per day per unit of water (4,200 gpd). Additionally, the existing 8-inch waterline within Edita Street is looped and therefore adequate to provide the required 2,000 gallons per minute of flow for fire protection, as per the Department's Water System Standards for schools. The applicant is proposing to connect to the existing county water supply infrastructure for its potable water needs. The applicant would provide its non-potable water supply needs with an extensive rainwater collection system consisting of catchment tanks, storage reservoirs/tanks with a network of water lines to distribute the collected water throughout the campus. According to the Department of Water Supply, the potable water system and the catchment system cannot be interconnected. It may become eviđent during the design of the development that a potable well is needed. The applicant will then need to conduct additional detailed analyses and apply for additional permits.

27. **Wastewater System:** Currently, there is no municipal wastewater system serving the Kaūmana area. The applicant would have to provide its own wastewater system meeting with the State Department of Health regulations. The applicant intends to implement a biological wastewater system unless it is not economically feasible then the school can resort to installing a traditional septic system with leach fields or other disposal system as deemed appropriate.

28. **Utilities:** Electrical and telephone services are available to the property.
AGENCIES’ COMMENTS

29. Department of Public Works: (Planning Department Exhibit 2 – August 28, 2012 and September 18, 2012 Memos)
30. Department of Water Supply: (Planning Department Exhibit 3 – August 29, 2012 Memo)
31. Department of Environmental Management: (Planning Department Exhibit 4 – August 2, 2012 Memo)
32. Police Department: (Planning Department Exhibit 5 – August 13, 2012 Memo)
33. Fire Department: (Planning Department Exhibit 6 – August 8, 2012 Memo)
34. Department of Land and Natural Resources-Land Division: (Planning Department Exhibit 7 – August 28, 2012 Letter)
35. Department of Health: (Planning Department Exhibit 8 – August 9, 2012 Memo)
36. Office of Planning: (Planning Department Exhibit 9 – October 3, 2012 Letter)

AGENCIES - NO RESPONSE

37. Parks and Recreation, Department of Land and Natural Resources – State Historic Preservation Division, State Land Use Commission, Department of Agriculture and the Department of Education.

APPLICANT’S RESPONSE TO AGENCY COMMENTS

38. The applicant has submitted several response letters to agency comments. (Planning Department Exhibit 10 – Letters dated September 10, 20, 21 and 28, 2012 and October 3, 2012)

AUTHORIZATION LETTER

39. The Department of Land and Natural Resources-Land Division has submitted a formal letter of authorization allowing the applicant to submit the Special Permit application. (Planning Department Exhibit 11 – October 2, 2012 Letter of Authorization)

PUBLIC COMMENTS

40. The Planning Department has not received any objections or comments from the general public or adjacent landowners on the subject application.

Public Notice - Direct Lease to Public Charter Schools

PUBLIC NOTICE
INTENTION TO DIRECT LEASE

Pursuant to Sections 171-16(c), Hawai‘i Revised Statutes, the Board of Land and Natural Resources hereby gives notice of its intent to lease 70.150 acres of State land situated at Ponohawai, Kukua‘u 2nd, SouthHilo, Hawai‘i; and, identified as Tax Map Key: (3) 2-5-06:141 to the Connections New Century Public Charter School [§ 171-85.5]. This lease shall enable the lessee to utilize said parcel for its school.

Pursuant to Section 171-43, Hawai‘i Revised Statutes, and the minimum rent policy established by the Board at its meeting of May 13, 2005 under Agenda Item D-19, the annual rent will be set at $480.00.

Information related to this proposed direct lease may be reviewed during office hours at the Department of Land and Natural Resources, Land Division, 75 Aupuni Street, Rm. #204, Hilo, Hawai‘i; and, at the offices of the Land Division on the Islands of Kaua‘i, Maui, and O‘ahu. Call, or write to any of these offices to request information in an alternate format.

DONE at the office of the Department of Land and Natural Resources this 1st day of May, 2012.

BOARD OF LAND AND NATURAL RESOURCES

October 22, 2010

Dear Ms. Kealoha,

Subject: Finding of No Significant Impact (FONSI) for Connections Public Charter School Master Plan, TMK (3) 2-5-006:141, South Hilo, Hawaii'

The Department of Land and Natural Resources has reviewed the comments received during the thirty (30) day public comment period which began on August 23, 2010. The agency has determined that this project will not have significant environmental effects and has issued a FONSI. Please publish this notice in the next available OEQC Environmental Notice.

We have emailed a completed OEQC Publication Form to your office and submitted one hard copy and one .pdf format of the Final Environmental Assessment.

If there is anything we can help you with or if you have any questions, please do not hesitate to contact Charlene Unoki from my Land Division at 587-0433. Thank you.

Sincerely,

Connections Public Charter School (Connections) opened in August 2000, with 184 students in grades K-6. By August 2001, the school had expanded to a K-12 program with a total of 360 students. Connections’ maintains an enrollment waiting list today, evidence of the school’s
success and the need and desire amongst the Hilo community for alternative educational opportunities.

Currently, Connections is operating from two separate campuses. The elementary and middle school are located in the Kress Building on Kamehameha Avenue in downtown Hilo, while the high school is located in leased facilities at the Nani Mau Gardens, just outside of Hilo town. The desire to vacate the leased facilities in which the high school operates has provided the impetus to explore options for consolidating all of the academic programs at a single location.

Consolidation presents an attractive option for management, operational, and financial reasons. The new campus would provide a long-term base of operations for Connections and improve the quality and diversity of education the school can offer its students. Building a new campus from the ground up provides the opportunity to develop academic facilities that are tailored to Connections’ specific educational philosophy and approach to teaching and learning, and would create a unique learning environment for this multi-cultural, globally-oriented charter school.

In coordination with the State of Hawai‘i Department of Land and Natural Resources (DLNR), a State-owned property in Ka‘ūmana was identified by the school as a potential site for the new campus. Connections has requested and received approval from DLNR’s Board of Land and Natural Resources (BLNR) for a long-term land lease for the Ka‘ūmana property. On May 1, 2012 DLNR published a public notice stating their intent to issue a direct lease of the Ka‘ūmana property to Connections Charter School. A copy of this notice is attached as Exhibit A.

1.1 Environmental Assessment
In order to receive BLNR approval of the land lease, Connections was required to comply with Hawaii Revised Statutes (HRS) Chapter 343 by preparing an environmental assessment (EA). The EA was required because the project would use State land. A Draft EA was completed and published in the Office of Environmental Quality Control’s (OEQC) The Environmental Notice in August of 2009. Supporting studies appended to the Draft EA included biological surveys (botanical, invertebrate, avian and mammalian), an archaeological assessment survey, and a traffic impact assessment report (TIAR).

During the 30-day public review of the Draft EA concerns were raised about the project’s potential impacts on Ka‘ūmana Cave, a segment of which underlies the Property’s upper parcel. Concerns expressed included impacts to possible historic resources and the cave ecosystem. In response to these concerns and at the request of the State Historic Preservation Division (SHPD), an archaeological field inspection of the accessible portion of Ka‘ūmana Cave that underlies the Property’s upper parcel was conducted. With the exception of names carved into the cave walls, no historic elements were found during the inspection. Connections also chose to revise the conceptual campus plan by relocating the major built facilities entirely within the property’s lower parcel and maintained a minimum 100-foot buffer on either side of the cave alignment to alleviate concerns about impacting the cave ecosystem. The Draft EA was amended to address the revised conceptual campus plan and was published in The Environmental Notice in August 2010 initiating a second 30-day public review period. Comments received during this 2nd public
review were responded to, and DLNR determined that the project would not have significant environmental effects and issued a Finding of No Significant Impact. The Final EA was published in *The Environmental Notice* in November 2010 and is attached to this application as Exhibit B.

2. **Statement of Objectives and Reasons for the Request**

Community-Based Education Support Services – Friends of Connections (Applicant), Connections Public Charter School’s affiliated non-profit, is requesting a Special Permit to develop a new school campus for Connections in Kaīmāna. The new campus would allow Connections to consolidate their academic programs at a single location and provide facilities that support the goals and visions of the school. One of those visions is implementation of a forestry/conservation program and a sustainable agricultural program. A new location outside of downtown Hilo would provide an improved educational environment and the necessary land area to expand the academic program to include the desired sustainable agricultural and forestry components.

The objective of the request is to allow the Applicant to continue its planning efforts to develop a new campus in Kaīmāna. A conceptual master plan, representing the ultimate vision for the property, has been developed. While the conceptual plan acts as a guide, unresolved issues do remain, particularly with regards to infrastructure and engineering. Securing the Special Permit would facilitate fundraising efforts so that additional studies and planning/design work can continue, which would aid in resolving these outstanding issues. Approval of the Special Permit would also allow the Applicant to implement the initial phases of the school while they continue to work at resolving infrastructure and financial constraints.

3. **Description of the Property**

The Property is located in Kaīmāna, South Hilo, on the eastern side of the island of Hawai‘i and is identified by Tax Map Key (TMK) (3) 2-5-006:141. The Property is owned by the State of Hawai‘i. In January 2011, the Board of Land and Natural Resources approved Connections’ request for a general lease of the Property for school purposes. Execution of the lease is pending completion of the lease documents.

The Property is approximately 70 acres in size and is situated on Mauna Loa’s lower slopes, approximately 2.5 miles above Hilo town, and south of Kaīmāna Drive. A location map is provided as Exhibit C. The project site is separated into two parcels at its narrowest point by Edita Street. The upper parcel comprises roughly 33 acres, and the lower parcel 37 acres.

The Property is currently undeveloped and there are no existing uses or structures. The terrain of the property gently slopes downhill from southwest to northeast. Elevations within the property range from 600 to 750 feet above mean sea level (msl) in the lower (eastern) parcel and 750 to 900 feet above msl in the upper (western) parcel. The lower parcel is characterized by a mix of native and non-native botanical species, with non-natives more common along the outer edges of
the property. The upper parcel is characterized by a native 'ōhiʻa forest with an under story of uluhe (Pacific false staghorn fern). An accessible segment of Kaʻūmaka Cave underlies the upper parcel of the project site.

4. PROJECT DESCRIPTION

4.1 Proposed Use

Connections would like to develop a new academic campus on the Property and has developed a conceptual master plan, which includes elementary, intermediate, and high school facilities, and common facilities to support these programs. The conceptual plan also provides facilities for a forestry/conservation program, a sustainable agricultural program and a small intergenerational program, all of which Connections currently does not have, but would like to implement. Intergenerational programs provide childcare and elder care at a single facility, which fosters interaction and exchange between the two groups through the sharing of knowledge, experience, and skills. Plot plans/site plans of the project site are attached as Exhibits D.1 through D.3.

Lower Parcel

All major school facilities are proposed to be located within the lower parcel. Buildings would be small in scale and organized in clusters of single-story buildings to create a more village-like atmosphere. Buildings would also be elevated off the ground to lessen the amount of grading and land modification necessary.

Major school facilities include the elementary, intermediate and high school classroom buildings, the administrative center, the library/resource center, the kitchen/dining facility, a gymnasium/multi-purpose building, green/shade houses, a 6-horse barn, a maintenance building, a 30-person dormitory, a caretaker's residence, and a small facility to house the intergenerational program. These facilities would support a projected 167 elementary students, 107 intermediate students, 107 high school students (381 K through 12 students), and 25 intergenerational clients. The dormitory would serve a maximum of 30 non-traditional students. Connections envisions these non-traditional students to be visiting or exchange students or educators that would stay at the school for limited periods (e.g., 1 to 2 weeks at a time). Thus, the dormitories are not likely to be continuously occupied throughout the year.

Buildings would be single story and oriented to take advantage of natural lighting and ventilation. Buildings are intended to be of lightweight construction; most would be elevated off the ground and supported by shallow concrete pier foundations. Typical building sections and renderings are attached as Exhibit D.4 through D.9. Building heights would average 15 to 25 feet from ground surface to the roof peak, depending on the slope of the ground. The gymnasium/multi-purpose building would be taller than the rest of the buildings, roughly 30 to 35 feet. The buildings would be linked by a curved spine, which would primarily serve as a pedestrian mall, but would also be used as a service and emergency access road.

The campus would have a single vehicular access from Edita Street. Existing vegetation would either remain or be replanted with different varieties of trees and shrubs to provide a visual
buffer at the entrance of the access road, which would purposely limit visibility of the campus from Edita Street and properties upslope from the proposed campus.

The campus’ main parking lot would have an estimated capacity of 88 stalls. Parking lot design and stall counts are based on preliminary facility square footages. During the design phase, facility square footages will be refined and stall counts would be adjusted as needed to comply with county code. The intergenerational program and the dormitory would be located to the north of the main parking lot. The dormitory would consist of two buildings, one for female occupants and one for males. The intergenerational program would have its own facility, which includes an outdoor play area that is located away from the elementary, intermediate and high school facilities.

At the end of the access road would be a vehicular roundabout. Surrounding the roundabout are the gymnasium/multi-purpose building to the west and the administrative center to the northeast. The gymnasium would be approximately 10,500 square feet and the administrative center about 3,000 square feet in size.

Leading eastward from the roundabout is a curved pedestrian mall/service road that extends to the north of the campus. The path would mainly serve as a pedestrian mall and would double as a service and emergency access road. A dedicated covered pedestrian walkway would run parallel to the mall. The mall would provide primary access to the elementary and intermediate school facilities, the kitchen/dining facility, and the library/resource center.

North of the roundabout is a branch road that leads to a secondary parking lot, which has a capacity of approximately 52 parking stalls. This parking lot would mainly serve the high school students. The high school facilities are located in the northern part of the campus, adjacent to the high school parking lot and include classrooms, an art, music, and science complex and two green/shade houses.

Close to the high school green/shade houses are the horse barn and the maintenance shop. A small road would connect the high school parking lot to a small loading and parking area that would service the horse barn.

The total gross square footage of the campus facilities would be approximately 90,000 square feet.

Upper Parcel
While no major school facilities are being proposed for the upper parcel, Connections intends to use this land area to support a future forestry/conservation program, which focuses on forest resource management and conservation, and forest ecosystem restoration. Restoration projects would reintroduce, within the existing ʻōhīa forest, some of the native species that historically grew in the area such as koa and hapuʻu fern. It is currently estimated that roughly 20 acres of the upper parcel could be used for reforestation projects. This acreage is subject to change once on-the-ground conditions can be assessed and suitable reforestation areas identified.
A walkway is being proposed for the upper parcel to provide access and viewing opportunities within the 'ōh'ia forest. The walkway would not be constructed at grade, but elevated on posts, roughly 4 to 5 feet above grade. The walkway would be a lightweight structure with shallow footings or pier foundations. Connections plans to fence off the property and will control access to the walkway and the upper parcel. This walkway is the only structure being proposed for the upper parcel.

**Sustainability**

Connections plans to construct a green school and envisions that their new campus be a model of sustainable development and design. At a minimum, the school will achieve a Silver rating under the Leadership in Energy and Environmental Design (LEED) Green Building Rating System, but will strive for a higher LEED certification if opportunities present themselves. The campus’ design would incorporate ways to reduce the school’s carbon footprint. Alternative and sustainable energy sources, such as wind and solar power, as well as sustainable strategies and technologies for water use, would be integrated wherever possible. Examples of sustainable strategies and technologies for energy and water use being considered in the conceptual plans include the following:

- **Temperature Control** – Building orientation would help to regulate internal temperatures. The majority of buildings would be oriented to minimize morning and evening heat gain. South facades would be properly shaded using energy and heat reflection tools, such as strategically placed large eaves and overhangs, landscaping, light shelves, and vertical louvers. Roofs would be insulated and light in color to minimize heat absorption.

- **Air Movement** – Buildings would be constructed to maximize utilization of natural air movement for cross-ventilation, providing slightly larger air outlets than inlets, employing stack ventilation strategies and clerestory windows, cupola (barn), thermal chimneys, ridge vents, and ceiling fans.

- **Lighting** – North light would be maximized through the use of clerestory windows and glare minimized through the use of shading devices and large overhangs. Translucent structural roofing could also be used to provide additional natural light penetration.

- **Energy Production** – Use of high-efficiency, unobtrusive, photovoltaic laminates (solar panels) would be used, and southern roof exposure angles would be oriented for maximum solar gain.

- **Water Efficient Fixtures** – Use of water efficient fixtures such as waterless urinals, high efficiency toilets or low/dual-flush toilets would help reduce the project’s potable water demand. Further reducing the demand for potable water would be the utilization of captured rainwater for toilet flushing.

- **Rainwater Collection** – The campus would include an extensive rainwater collection system designed to capture rainwater from building rooftops for use in toilets, custodial purposes, and for some agriculture uses. Capture and use of surface runoff may also be considered.
• **Use of Recycled Water** — Use of recycled water for irrigation as allowed by applicable regulations.

**Landscaping**
For the upper parcel, no formal landscaping is proposed as it is Connections’ intention to maintain the existing native 'ōhi'a forest with incorporation of reforestation projects in selected areas.

For the lower parcel, minimal formal landscaping is proposed. Excluding the built-up and cultivation areas, the existing vegetation would serve as the primary landscape material, particularly around the edges of the property, near Edita Street and existing residences. Pockets of existing native forest within the lower parcel would be maintained and incorporated as part of the overall parcel landscaping. There may be some replacement of existing vegetation, particularly if existing vegetation is invasive or non-native. Outplanted native vegetation could be used as replacement plants.

Where intentional formal landscaping would be provided, such as in the immediate vicinity of buildings, native plants that are well-suited to the localized environment and that require minimal maintenance would be used. There would also be some manicured, grassed areas, such as the play field.

**Agricultural and Forestry/Conservation Programs**
With the new campus, Connections would like to incorporate a sustainable agricultural program into their academic offerings. Approximately 14 acres of the lower parcel’s eastern portion would be allocated for agriculture and forestry uses. Cultivated crops are anticipated to include fruits and vegetables, native trees and plants, and ornamental plants.

The goal of the agricultural program is to provide students with hands-on experience in sustainable agricultural practices through a working, self-sustaining farm. One of the objectives of the program is to provide students a farm-to-table awareness of food production, which serves to strengthen understanding of how food is grown, acquired and eaten. Crops, orchards and livestock would be maintained by the students and produce grown on the campus would be used in the school’s food service program. The comprehensive program would include waste management, composting, and exposure to food production, management, processing, distribution, marketing, sales, and other agricultural services.

Some livestock are also planned as part of the agricultural program and would consist of a small numbers of chickens, sheep, goats, and horses. Initially, it is estimated that the small livestock program would have approximately 30 chickens and a pair each of sheep, goats and horses. At full development, it is projected that there would be no more than 30 chickens, a pair of breeding horses with foals kept until sold, and about a dozen sheep and goats.

As an adjunct to the agriculture program, the school plans to implement a forestry/conservation program, which would include some reforestation projects. The forestry/conservation program
would utilize both the upper and lower parcels. The entire upper parcel would be dedicated to the forestry/conservation program, as well as areas of the lower parcel that support existing native forests. Wood harvested from the lower parcel during thinning and clearing activities are planned to be used as building materials for school facilities. Harvested wood would also support the school’s Makery Cloud project. The Makery is a computer-aided design and computer-controlled fabrication system that enable students to transform their concepts into actual products. The Makery Cloud project uses Science, Technology, Engineering and Mathematics (STEM) initiatives and applies them to concept development and product generation.

**Infrastructure**

Electrical, telecommunication and potable water infrastructure is available to the project site. The project will achieve, at a minimum, LEED Silver certification. If feasible, a higher certification will be striven for. Project features to achieve LEED certification would reduce demand for electricity and potable water. These include the use of photovoltaics and an extensive rainwater catchment system.

The County of Hawai‘i Department of Water Supply (DWS) has stated that potable water allocation to the property is limited to 4,200 gallons per day (gpd). Based on a 60 gpd per student standard, the 4200-gallon allocation could support 70 students. Due to the limited amount of potable water, agriculture and landscape irrigation would rely solely on rainfall, supplemented by recycled wastewater effluent and catchment water; no DWS-supplied potable water would be used. Potable water usage could be further offset by the use of rain catchment for toilet flushing and custodial uses. The project would likely involve separate potable and non-potable water systems. To support the rainwater catchment system, a minimum of two tanks—a catchment tank and a reservoir tank—would be needed. Due to the probable incremental development of the campus over several years, multiple smaller tanks would likely be implemented. These water tanks are shown conceptually on the site plans; however, these locations are subject to change after further engineering studies and a detailed topographic survey are completed and on-the-ground conditions are assessed. Further, during the design phase, the actual number and size of these tanks would be determined based on amount of captured rainfall to be collected and the amount of reserves needed to support the campus’ non-potable water uses. Catchment and reservoir tanks could be as large as several hundred thousands of gallons each. A typical elevation of an approximately 300,000-gallon water tank is attached as Exhibit D.10. The Applicant understands that the availability of water does constrain the scope of development on the property and intends to investigate other sources of water to support the project.

The Ka‘ūmana area is not served by a municipal wastewater system. Therefore, like all the surrounding properties, Connections would have to provide its own wastewater system as part of the project. An ecological wastewater treatment system would be implemented for the school. One well-known and established system is called the “Living Machine.” This type of system is Connections’ preferred option over a conventional septic system. Biological treatment systems are on-site, environmentally friendly systems that mimic the cleansing functions of wetlands and
consist of a settling tank(s) and series of tanks/systems (underground or aboveground, depending on the specific design of the system) that progressively clean the wastewater. Bacteria, algae, plants, and other organisms, such as snails and fish, are used to break down and digest the organic pollutants. It is virtually an odor-free process. The end product is R-2 quality water that can be reused for some non-potable uses such as some agricultural irrigation. Use of recycled water would comply with the State Department of Health’s Guidelines for the Treatment and Use of Recycled Water, including the preparation and approval, as needed, of an irrigation plan, a management plan, a public education plan, an employee training plan, a vector control plan, and a monitoring plan. On the campus site plan, an approximately 12,000-square-foot area has been set aside for the biological treatment system. This area is based on early rough estimates of wastewater volumes. During design development, estimated volumes would be refined as they can be based on fixtures counts and also take into account water reduction features included in the project. Thus, this set aside area may be smaller in size than what is shown on the site plan or could be developed as multiple smaller units to coincide with incremental development of the campus.

4.2 Project Timetable and Phasing
The timetable for full build out of the school campus is roughly projected to take from 16 to 25 years. This timetable is highly dependent on the Applicant’s ability to obtain the necessary financial resources. Given the amount of money required to develop the infrastructure and construct all of the school’s facilities, development of the proposed project would likely be implemented in phases, with each phase being initiated as funds become available. A preliminary gross estimate of the project cost is approximately $30 million.

Applicant intends to fund the project through various sources. The Applicant has applied for a long-term, low-interest loan from the United States Department of Agriculture (USDA). Recent communication with the USDA has indicated that approval of the loan looks very promising. If approved, this loan would provide approximately $8 million dollars to start implementing the project’s initial phases (Phase 1, 2 and 3). Future funding is expected from operational money the Applicant receives through rental income from the Kress Building, grants, and private donations. The Applicant currently has an active capital campaign to raise funds for the project, which includes annual in-house donations from the school’s staff. It is also possible that capital improvement funds and/or facility funds may become available from the State.

The sequence of the implementation phases is based on a set of priorities developed by the school to meet its curriculum and operational needs, which are as follows.

- Priority 1 - Agriculture and forestry/conservation programs and caretaker’s residence
- Priority 2 - High school facilities
- Priority 3 - Intermediate school facilities
- Priority 4 - Elementary school facilities
- Priority 5 - Gymnasium/multi-purpose facility, dormitory, residence, and intergenerational facility
As noted above, project implementation is highly dependent upon the availability of funds. Thus, the projected implementation phases (Exhibit D.11) and timetable shown below accounts for the need to acquire funding to initiate successive project phases.

**Implementation Phase**

**4.3 Hours of Operation**

The school’s hours of operation would be typical of an academic institution. Weekday hours span from 7:00 am to 5:30 pm. The elementary and intermediate instructional hours are 7:30 am to 2:00 pm Monday through Thursday, and 7:30 am to 1:00 pm on Friday. The high school’s
instructional hours are 7:45 am to 2:15 pm Monday through Thursday, and 7:45 am to 1:15 pm on Friday. Most of the instructional staff work from 7:30 am to 3:30 pm and the school’s main office is open from 7:00 am to 5:30 pm.

There may be some limited extra-curricular activities at the Kaʻūmana campus; however, most, such as dances and graduation, would occur off-site at other locations in the community and at the Kress Building. Weekend activities connected to the agriculture program may be conducted. These anticipated activities would include special work days and weekend care of the crops and livestock by a school staff member.

4.4 Number of Employees/Clientele
Connections currently has a staff of 50 full-time and 17 part-time employees. This includes faculty, administrative staff and support staff. Under a full development scenario, the school would maintain roughly the same number of employees.

5. STATE AND COUNTY PLANS AFFECTING THE SUBJECT REQUEST
5.1 State Land Use Classification
The Property is located in the State Land Use Agricultural District. Uses other than those strictly defined in Hawai‘i Revised Statutes 205-4.5 are allowed by Special Permit within the Agricultural District if the soils are classified by the LSB as having an overall productivity rating of C, D, E or U. The Property has an LSB overall productivity rating of D.

5.2 County General Plan
The Property is designated as Low-density Urban on the County General Plan’s LUPAG map. The Low-density Urban designation is defined by the General Plan as residential, with ancillary community and public uses, and neighborhood and convenience-type commercial uses.

5.3 County Zoning
The Property is zoned A-1a by the county. The proposed project’s forestry and agriculture components are permitted uses within the county Agricultural district. Schools are an allowable use within this zoning district with a Use Permit; however, because the Property is also within the State Land Use Agricultural District and greater than 15 acres, a Special Permit rather than a Use Permit is required.

5.4 Other
The Property is not within the Special Management Area nor is it within an area covered by a community plan.

6. SURROUNDING ZONING AND LAND USES
Much of the land surrounding the Property historically was used for agriculture. Over time, some of these areas have been converted to residential use, although some agricultural uses remain. The Property is bounded along much of its perimeter by residences located on Kaʻūmana
Drive, Edita Street, and Melemanu Street. West of the property, on the far side of Kaʻūmana Drive, is the main entrance to the Kaʻūmana Cave, which has been designated as Kaʻūmana Caves County Park. Undeveloped land bounds most of the southern boundary of the lower parcel.

The Property is zoned A-1a (Agricultural – minimum 1 acre lot size). Lands south of the Property are also zoned for Agriculture (A-10a and A-20a). Lands to the immediate north are zoned predominantly for Single Family Residential use (RS-10 and RS-15), with some Open-zoned areas, which include the Kaʻūmana Caves County Park and a strip of land abutting the lower parcel. Land beyond some of the residences on the north side of Kaʻūmana Drive is zoned for Agriculture (A-3a and FA-2a).

7. FLOOD INSURANCE RATE MAP
The Federal Emergency Management Agency (FEMA) has classified the area in which the Property is located, as Zone X. Zone X is land with no recognized flood potential and is located outside both the 100-year and 500-year floodplain. This classification means that the property is located outside of the 0.2 percent annual chance floodplain, and that no base flood elevations or depths are shown for this zone (NFIP, 2009). The risk of flooding from large surface water flood events is low.

Although rare, high flow events have been known to occur from storm water that flows through Kaʻūmana Cave. Water that naturally seeps into Kaʻūmana Cave during periods of high rainfall along with surface runoff from the upper regions of Kaʻūmana Drive that enter into Kaʻūmana Cave can create high flow conditions. As storm waters are channeled through Kaʻūmana Cave, there is the potential that water volume could be high enough to exit the cave system through the opening on Edita Street. From the Edita Street exit, storm water then flows through a concrete channel running parallel to, and alongside Edita Street, where it is directed into a culvert underneath the road and into an intermittent stream that borders the lower parcel’s southern boundary. During very severe storms, water has been known to overtop the concrete channel and flow across Edita Street, resulting in some flooding of adjacent areas.

8. ARCHAEOLOGICAL RESOURCES
An archaeological assessment survey of the Property was conducted in 2008 by Pacific Legacy, Inc. At the request of the State Historic Preservation Division (SHPD), a supplemental field inspection of Kaʻūmana Cave was also conducted by Pacific Legacy, Inc. These two reports are included as Appendices E and F in the Final EA (Exhibit B). The following summarizes the findings of both reports.

8.1 Field Investigations of Surface Area
Research has found little evidence of human activity in the project area during the pre-Contact period. Boundary commission records indicate that bird hunting was carried out in the forests further inland and that Hilo was a major pre-Contact settlement and agricultural area. At the time of the Māhele ʻĀina in the 1840s (also known as the Great Māhele), two parcels adjacent to
the project area were awarded to native claimants. The first parcel was part of an inherited claim to three land areas: Kukuau 2 in Hilo, Waikoloa in South Kohala, and Kiʻiʻai 2 in South Kona. Because the claim covers such a large area, the document does not have any direct information about the Kukuau parcel. The second parcel, located immediately north of the project area, was claimed by an individual named Kukuleau. This indicates that there was at least some human activity in the area during that period. Kaūmana may have held scattered homesteads, probably near Waipahoe Stream, but these would have been destroyed by the 1880-1881 lava flow.

The entire project area is situated on the 1880-1881 lava flow and as a result it is surmised that any pre-existing archaeological or historic sites within the project area would have been destroyed by the flow. During the field investigation, no archaeological sites were encountered and it appears that subsequent to the 1880-1881 lava flow, permanent human use of the area stopped.

8.2 Field Inspection of Kaūmana Cave
An archaeological investigation was conducted of the accessible portion of Kaūmana Cave that underlies the Property’s upper parcel. One of the purposes of this inspection was to verify previous accounts of historic elements within the cave, which include petroglyphs (names chipped into the cave’s walls) and electrical insulators on the cave walls. The portion of the cave that underlies the Property’s lower parcel was not inspected as it is believed to be inaccessible.

The field inspection found an abundance of pecked names near the cave entrance at the county park. Deeper into the cave, the pecked names become more sporadic with occasional dense concentrations. The deepest concentration of names encountered were roughly 850 feet from the cave entrance, which would place this location directly beneath Kaūmana Drive, outside the project site. Beyond that point only two sets of pecked names were noted, both of which appear to be recent. In addition to the pecked names, numerous names have been spray painted onto the cave walls. No names that appear to be older than 50 years were found in the cave segment that underlies the upper parcel. The field inspection also found no evidence of “electrical insulators attached to the cave wall.” The inspection report concluded that with the exception of the pecked names, no historic elements were encountered in the accessible portion of Kaūmana Cave that underlies the project site.

By letter dated August 17, 2010, Connections Public Charter School (through Wil Chee – Planning & Environmental) requested a letter of “no effect” from SHPD based on the findings of the archaeological assessment survey and the field inspection of Kaūmana Cave. SHPD did not provide a response within the 30-day limit. To date, no response has been received from SHPD. Correspondence with SHPD is attached as Exhibit E.

9. FLORAL AND FAUNAL RESOURCES
A biological assessment, which encompassed flora, vertebrates and invertebrates, was completed for the Property in 2008-2009. The assessment concluded that there is nothing unique about the project site or its vegetation and the construction and operation of the school would not adversely impact native avian or mammalian resources in the project area. The following discussion
summarizes the findings of the assessment. The full report is included as Appendix D in the Final EA, which is attached as Exhibit B.

9.1 Botanical Resources
The botanical survey of the Property was undertaken on December 10 and 11, 2008. During the survey a total of 65 plant species were identified, 11 of which are classified as native, or occurring naturally, to the Hawaiian Islands. No protected plant species were recorded during the survey. A complete listing of plant species found within Property can be found in the biological survey report.

As previously noted, the Property is located on the Mauna Loa lava flow of 1880-1881. Thus, vegetation within the Property reflects the largely native plant community that developed after 1881 lava flow. As the surrounding properties came to be developed and Saddle Road was constructed, opportunities opened for non-native species to invade the native plant community. Botanically, the project site does support a largely native ecosystem, though it is not unique for the area.

Despite the lack of soil, the relatively high rainfall in the project area has resulted in dense vegetation blanketing the project site. The upper parcel (west of Edita Street) is characterized as a native Lowland Wet Forest consisting primarily of ‘ōhi‘a trees (*Metrosideros polymorpha*) with a dense understory of Pacific false staghorn fern or ‘uluhe (*Dicranopteris linearis*)'. The dense ‘uluhe fern keeps most other species from colonizing this parcel. There is considerable variation in the density of the ‘ōhi‘a trees from place to place, but can approach a closed canopy where undisturbed. In contrast, vegetation in the lower parcel (east of Edita Street) consists of a mix of native and non-native plant species, including albizia (*Falcateria moluccana*) trees and forests of strawberry guava (*Psidium cattleianum*).

9.2 Invertebrate, Mammalian and Avian Resources
Invertebrate, mammalian, and avian field surveys of the Property were conducted between November 2008 and January 2009. During the surveys, a total of 20 invertebrate, 15 avian, and 1 mammalian species were documented to be present within the project site. A complete listing of faunal species encountered can be found in the biological survey report.

The 1880-1881 lava flow and the relatively young native forest it supports, has resulted in a limited diversity of Hawaiian host plants. Consequently, there is a limited number and diversity of native invertebrates at the project site. Additionally, the low elevation of the project site provides easier access to and has resulted in higher numbers of introduced predators, such as ants, which contribute to the low number of native invertebrate populations on site. Several native species of arthropods were observed during the survey; however, no federal or state listed endangered or threatened species were noted. Further, there is no federally-designated Critical Habitat for any invertebrate species within or adjacent to the project site.

Avian diversity and densities were consistent with the habitat present within the project area. Of the 15 different avian species recorded during this survey, all but two are alien to the Hawaiian
Islands. One indigenous migratory species, the Pacific Golden-Plover (*Pluvialis fulva*) was encountered during the survey. Additionally, a single Hawaiian Hawk (*Buteo solitarius*) or io was detected as an incidental observation while transiting between two count stations. The Hawaiian Hawk is an endemic endangered species currently protected under both federal and state of Hawai‘i endangered species statutes. The Hawaiian Hawk has recently been proposed for delisting.

Although none were observed during the survey, it is possible that the project site is over flown between May and December by the endangered endemic Hawaiian Petrel (*Pterodroma sandwichensis*) or ua‘u and the threatened Newell’s Shearwater (*Puffinus auricularis newelli*) or ‘a‘o. However, there is no suitable nesting habitat within or close to the project site for either of these two seabird species.

With the exception of the endangered Hawaiian hoary bat (*Lasiurus cinereus semotus*), or ope‘ape‘a, all terrestrial mammals currently found on the Island of Hawai‘i are alien species. Only one mammalian species was detected during the course of this survey, the domestic dog (*Canis f. familiaris*). During the survey tracks, scat and sign of dog were encountered and several dogs were heard barking from the adjacent residential lots.

Although, Hawaiian hoary bats were not recorded during this biological survey, bats have been recorded on numerous recent surveys conducted within the general Hilo area. Key findings include the opinion that, at least on the Island of Hawai‘i, the bat is ubiquitous in areas that still have forest or dense cover, and it can be expected that Hawaiian hoary bats use resources within the general project vicinity on a seasonal basis.

There is a small potential that construction activities or habitat modification could affect the Hawaiian Hoary Bat, the Hawaiian Hawk, the Hawaiian Petrel or the Newell’s Shearwater, all of which are protected under both federal and state endangered species statutes. However, precautionary measures as discussed in the biological assessment report would be implemented to reduce the potential for impacting these species.

**10. VALUED CULTURAL RESOURCES**

There have been no identified traditional or customary native Hawaiian rights exercised at the Property. The archaeological assessments conducted for the project in 2008 and 2010 did not identify any sites or resources that indicate that there has been much human activity at the Property since the 1880-1881 Mauna Loa lava flow.

In the late 1990s, one of the proposed alternative routes for the Puainako Street Extension and Widening project ran directly through the project site. Based upon work performed in support of that project’s EIS, no evidence of traditional cultural properties or practices were identified to occur within that project area, which encompasses the current project site (Okahara and Associates, 2000). This conclusion was based on several archaeological surveys, archival research, oral interviews and the lack of claimants offering knowledge of such resources.
Findings of the archaeological investigation conducted for the Proposed Action seem to support the conclusions made in the Puainako Street Extension and Widening project EIS. No archaeological surface features were encountered during the investigation. The absence of sites suggests that human activity at the project site has been limited since 1880, with the exception of an occasional pig hunter.

Further efforts were made to ascertain whether any cultural practices occurred within the project site. Requests for information were sent to the Hawaiian Civic Club of Hilo, the Edith Kanakaole Foundation and Mr. Kepa Maly in an attempt to identify any cultural resources and practices that may be conducted within or around the project site. No responses were received. A public information meeting was also held on April 16, 2009. No persons at the public information meeting spoke in regards to any cultural resources or practices occurring within the project site. Findings of the archaeological investigation, as well as the lack of response for information and public input seem to suggest that the conclusion reached by the Puainako Street Extension and Widening project EIS—that there are no traditional cultural practices occurring within the project area—are still valid. However, if any traditional or cultural practices are identified, Connections will make efforts to accommodate continuation of these practices.

11. PUBLIC ACCESS

The Property is not located adjacent to or near any shoreline or mountain areas; therefore, the project would not affect public access to these resources. During the environmental assessment process, some concerns were expressed by members of the public that access to Kaūmana Cave may be impacted by the proposed project. However, there is no public access point to the cave system from the Property. Public access to Kaūmana Cave from the nearby county park would not be affected by the proposed project.

12. DESCRIPTION OF ACCESS

Access to the Property is via Edita Street, which extends off Kaūmana Drive in a southeasterly direction, forming a 3-way intersection. Both Edita Street and Kaūmana Drive are County roads. Edita Street is a 2-lane, 2-way paved asphalt roadway. At its intersection with Kaūmana Drive, Edita Street has one inbound lane, one right turn out-bound lane, and one left turn storage lane. Moving away from the Kaūmana Drive intersection, Edita Street then narrows to approximately 20 feet and widens again as it approaches the Property. The paved width of Edita Street fronting the project site is approximately 48 feet, which accommodates the two travel lanes (20 feet), a 20-foot shoulder on the northeast or makai side of the road, and an 8-foot shoulder on the southwest or mauka side. This 48-foot paved width continues as Edita Street heads toward Melemanu Street. The road is in good condition.
13. **Traffic Impacts**

Existing traffic volumes in the project area are low and there are no signalized intersections in the immediate vicinity of the Property. The two primary circulation routes in the immediate vicinity of the project site are Kaūmana Drive located northwest of the site, and Edita Street, which bisects the site dividing it into its upper (western) and lower (eastern) halves. Current, traffic volumes in the project area are low and the adjacent roadways currently operate at a level-of-service (LOS) grade A or B. This implies good operating conditions, minimal delays, and high levels-of-service. There are six grades of LOS, ranging from A to F. A LOS of A represents the best condition, with little or no delay, and F is the worst with severe congestion and extreme traffic delays.

A Traffic Impact Analysis Report (TIAR) was prepared in support of this project during the environmental assessment process. The TIAR assessed future impacts of the project on local traffic and circulation patterns. The TIAR study methodology consisted of conducting an analysis of existing traffic conditions, determining future background traffic projections, and identifying future project-related traffic impacts from the project. The discussion in this section is based on the findings of the TIAR which is included as Appendix I of the Final EA (attached as Exhibit B).

Note that the findings of the TIAR are conservative and likely overestimates total trip generation for the project. The TIAR does not specifically take into account that approximately 30 percent of Connections’ students are bussed to school from outside Hilo and the likelihood that multiple students may be dropped off or picked up by one vehicle (i.e., families with more than one student at the school and carpooling).

Identifying traffic-related impacts of the proposed project involved determining project-generated traffic during the morning (AM), midday (end of school day), and afternoon (PM) weekday commuter peak period, and determining the LOS at affected roadway intersections subsequent to implementation of the project. If fully built, the proposed project would generate 108 inbound and 79 outbound trips (187 total trips) during the morning peak hour, 52 inbound and 72 outbound trips (124 total trips) during the midday peak hour and 31 inbound and 30 outbound trips (61 total trips) during the afternoon peak hour.

Based on the traffic generation data, an LOS analysis was performed and concluded that the majority of vehicular approach and movement patterns on adjacent public roadway intersections would experience little or no delays if the project is fully developed. The LOS analysis projects that traffic movements in the project area would continue to operate at LOS A and B, with over 73 percent of all movements operating at LOS A and 27 percent of movements operating at LOS B.

Based on the findings of the TIAR, project is not expected to generate large increases in traffic volumes and would not result in adverse impacts to traffic and circulation patterns in the project area.
14. **Utilities and Public Services**

14.1 Energy and Communications
Electrical services in the project vicinity are provided by the Hawaii Electric Light Company (HELCO) through overhead lines along Edita Street and Kaʻūmana Drive. Communications services are also available to the subject property through overhead lines along Edita Street.

14.2 Water Supply
The Hawai‘i County Department of Water Supply (DWS) provides water to the area via an existing 8-inch waterline along Kaʻūmana Drive and from an existing 8-inch waterline along Edita Street. The current water availability, which is subject to change, is limited to a maximum of seven units of water per pre-existing lot of record. Each unit of water is equal to a maximum usage of 600 gpd; therefore, a maximum of 4,200 gpd is available for the proposed project.

14.3 Wastewater
Currently, there is no municipal wastewater system serving the Kaʻūmana area, and the proposed project, like the surrounding area residences, would have to provide its own wastewater system.

15. **Public Meetings**

To date, four public meetings have been held for this project on the following dates: April 16, 2009; June 3, 2011; September 2, 2011; and April 27, 2012. The April 16, 2009 meeting was held prior to publication of the original Draft EA and presented the original conceptual campus plan to meeting attendees. No substantial issues were raised at this initial meeting. After the Final EA and FONSI were issued and the BLNR had approved ‘leasing the Property to Connections a second public meeting was held on June 3, 2011. Issues of concern raised at this meeting largely revolved around increased traffic along Edita Street and Kaʻūmana Drive, and security. The September 2, 2011 meeting was hosted by Councilmember Donald Ikeda in response to inquiries received from constituents. Again, the use of Edita Street as access to the proposed campus and related traffic was a concern of attendees. In addition, there were questions as to the Applicant’s contingency plans if the Special Permit is denied, if there was any cultural significance of the property, and if studies were done to identify how the project would affect property values. The most recent public meeting was held on April 27, 2012 at which it was strongly conveyed that planning for the new campus is an on-going process. The Applicant is open to discussions and is trying to work with the community to address its concerns with locating a school in the neighborhood. Concerns about traffic and access from Edita Street were again brought forth by attendees. The public meeting was followed-up the next day by a neighborhood canvassing effort. School representatives walked the adjacent neighborhoods to distribute project information and talk to residents one-on-one about the proposed project.

The one concern that has been consistently expressed through all the meetings is increased traffic in the area and the use of Edita Street to access the campus. Edita Street is the only public roadway that provides direct access to the Property’s lower parcel and will be used by the school as its primary vehicular access point. While the proposed project would increase the volume of traffic along Edita Street and Kaʻūmana Drive, the TIAR completed for the project concluded that
the resultant levels-of-service would still be acceptable. To address some of the neighboring community’s concerns, the Applicant has engaged in initial discussions with an adjacent landowner to determine the possibility of obtaining temporary construction access through his property, which would alleviate construction-related traffic impacts along Ka‘umana Drive and Edita Street. A final decision has not been made and talks are on-going.

16. **GROUNDS FOR SPECIAL PERMIT**

16.1 Granting of this request would promote the effectiveness and objectives of Chapter 205, Hawaii Revised Statutes, as amended. Include a discussion on how the proposed use is not contrary to Chapter 205A, Coastal Zone Management.

The guidelines provided in the State Land Use Law for establishment of Agricultural district boundaries are intended to provide the greatest possible protection to those lands with a high capacity for intensive cultivation. The Property’s soils are classified by the LSB as “D” (Poor) for agricultural productivity and the State of Hawaii (ALISH) system indicates that the Property is not classified as Important Agricultural Land or Agricultural Lands of Importance to the State of Hawaii.

Despite its soil classification, the Applicant, as part of their overall educational goals would like to incorporate agriculture and forestry/conservation program into their academic offerings on both the upper parcel which is approximately 33 acres and the lower parcel which is approximately 37 acres. The agricultural program would provide students with hands-on experience in sustainable agricultural practices and would emphasize small sustainable agricultural techniques. Agricultural program facilities proposed for the lower parcel would include greenhouses, a 6-horse barn and cultivated gardens. Cultivated crops may include vegetables, taro, fruit trees, native plants and ornamental plants. The agricultural program may also include some livestock (e.g. chickens, goats, pigs and horses). Reforestation projects proposed on the upper parcel would reintroduce, within the existing ‘ôh‘ia forest, some of the native species that historically grew in the area such as koa and hapu‘u fern. It is currently estimated that roughly 20 acres of the upper parcel could be used for reforestation projects. This acreage is subject to change once on-the-ground conditions can be assessed and suitable reforestation areas identified.

**Permissible uses within the agricultural districts**

A charter school “school” is not considered a permitted use within the State Land Use Agricultural District; however, uses not expressly permitted may be allowed in the Agricultural District by Special Permit on lands having soils with an overall productivity rating of C, D, E or U. As mentioned above the LSB designates the Property as Class D. The Applicant seeks approval of a Special Permit which has been prepared discussing the objectives of HRS Chapter 205.

**Zoning**

A charter school “school” is not considered a permitted use within an area that has been zoned Agricultural 1 acre (A-1a); however, Hawai‘i County Code Section 25-5-72 (d) provides that
schools may be permitted the in Agricultural district, provided that a Special Permit is issued for
the use.

In addition the County of Hawai‘i LUPAG Map designates the Property as Low Density Urban.
The campus is envisioned to keep site grading to a minimum. Buildings would be single story,
small in scale and oriented to take advantage of natural lighting and ventilation. Vegetation
would either remain or be replanted with different varieties of trees to provide a visual buffer
maintaining the low-density character of the Property and the surrounding area.

Geothermal resource subzones
The State Board of Land and Natural Resources shall have the responsibility for designating
areas as geothermal resources subzones. Geothermal resources subzones may be designated
within any State Land Use district and allow for exploration, development or production of
energy from geothermal sources. The Property is not located within a geothermal resource
subzone.

Special Permit
The Applicant is allowed to apply for a Special Permit, which may permit certain, unusual, and
reasonable uses (i.e., school) within agricultural and rural districts, other than those for which the
district is classified.

Coastal Zone Management
“Coastal zone management area” includes all lands of the State and the area extending seaward
from the shoreline to the limit of the State’s police power and management authority, including
the U.S. territorial sea. “Shoreline” is defined as the upper reaches of the wash of the waves,
other than storm and seismic waves, at high tide during the season of the year in which the
highest wash of the waves occurs, usually evidenced by the edge of vegetation growth, or the
upper limit of debris left by the wash of the waves. While located within the coastal zone
management area, the Property is not located near the shoreline.

The proposed project is in compliance with the policies and objectives of Hawaii’s coastal zone
management program to protect the following resources (as specified in HRS Chapter 205A):

i. Recreation: The Property is located almost 3 miles from the nearest shoreline, which is
   Hilo Bay. Thus the proposed project would not affect access to coastal recreational
   opportunities.

ii. Historic: No historic or prehistoric resources have been identified on the Property. An
    archaeological field investigation of the Property was conducted and no archaeological
    sites were encountered. The Property lies within the 1880-1881 lava flow and it is
    surmised that any pre-existing archaeological or historic sites in the project area would
    have been destroyed by the flow.

iii. Scenic and Open Space: The proposed project would not significantly affect coastal
    scenic and open space resources. Campus buildings would be small in scale and one-
    story in height, thus minimizing impacts to view planes. Connections also intends to
maintain the natural beauty of the Property by protecting and managing the Property’s native ‘ōhi’a forest through its planned forestry/conservation program.

iv. Coastal Ecosystems: The Property is nearly 3 miles from the shoreline would have no effect on coastal ecosystems. The proposed project would contain runoff from impervious surfaces on site and is expected to result in no net increase in runoff from the Property. The proposed project would not contribute to non-point source pollution that could be carried downstream to the ocean.

v. Economic: The proposed project can be expected to have direct and indirect beneficial economic impacts (e.g., construction jobs, diverse educational opportunities that enhance an individual’s future ability to contribute to the local and state economy) and is suitably located inland as it is not a coastal dependent development.

vi. Coastal Hazards: The Property is located outside of the tsunami inundation zone, and lies within a FEMA-designated Flood Zone X, which is land with no recognized flood potential, and is located outside both the 100-year and 500-year floodplain.

vii. Managing Development: Through the EA and Special Permit processes, the proposed project is in accordance with development review and public participation in the management of coastal resources and hazards.

viii. Public Participation: As part of the EA process there were two public comment periods. In addition, four public meetings related to this project have been held to date. Connections plans to continue dialogue with the neighboring community has the project moves forward.

ix. Beach Protection: The Property is located nearly 3 miles from the shoreline and would have no effect on beach protection.

x. Marine Resources: Planning for and management of marine resources is not relevant to the proposed project.

Special Management Areas
Special Management Areas place special controls on development to avoid permanent losses of valuable resources and to ensure that adequate access, by dedication or other means, to public-owned or used beaches, recreation areas, and natural reserves. The Property is not located within the Special Management Area along the shoreline.

16.2 The desired use shall not adversely affect the surrounding properties. The Property is not anticipated to have adverse impacts upon surrounding areas and is planned to mirror much of the surrounding land uses with modest single story structures, agricultural uses, and open, undeveloped areas for agricultural educational programs and forest restoration. The surrounding area consists of generally compatible land uses—single-family residences, agricultural uses, and vacant, undeveloped parcels. Much of the surrounding land, particularly along the southern boundary of the property, is similarly designated in the State Land Use Agricultural District, classified Low Density Urban or Rural on the LUPAG map, and zoned agriculture.

The project would have some impacts on the immediate neighborhood surrounding the Property. Noise and slight increases in traffic can be expected along Kaūmana Drive and Edita Street.
Development of the school would result in some increase in traffic volume, particularly during peak hours, along Kaʻūmana Drive and Edita Street in the immediate vicinity of the subject property. Due to vehicles turning left into the proposed campus, some delays to through traffic on Edita Street also can be expected. However, the impact analysis shows that even if the school is fully developed, the resultant levels-of-service would still be acceptable.

Developing a school on the Property may increase noise levels in the immediate neighborhood. Noise would generally be limited to school hours, though there could be occasional extra-curricular or weekend activities that may affect noise levels. These activities, however, would be conducted during reasonable hours to minimize any neighborhood disturbance. Typically noisier extra-curricular activities, such as school dances, would be held at off-site locations. Thus, impacts on ambient noise levels are not expected to be significant. Vegetation along the property’s boundaries adjacent to existing residences would also help provide a buffer from noise generated from school activities. Noise impacts can also be expected during construction. While bothersome, these construction noise impacts would be temporary and would be minimized by observing construction site BMPs and adhering to all applicable noise regulations.

Previous flood events in the Kaʻūmana area do raise potential concerns with regards to flood conditions. An extensive rain catchment system is being proposed that would collect runoff from building roofs and covered walkways. It is possible that some storm water runoff from the ground surface could be captured for reuse purposes as well. The catchment system could help lessen the amount of storm water runoff from the subject property. Storm water runoff that is not captured for reuse would be managed by a series of detention basins where detained water would evaporate and/or percolate into the ground. The Property has adequate land area that detention basins of sufficient number and size can be constructed to manage storm water runoff on-site. In accordance with the county’s Storm Drainage Standards (Department of Public Works), the on-site drainage system would be designed to capture runoff from a 10-year, 1-hour storm event, with the intention of containing the net increase in runoff generated by the proposed improvements. With the on-site drainage system, it is expected that storm water runoff from the project would not adversely affect surrounding properties or existing drainage systems and would not aggravate potential flood conditions downstream.

16.3 Such use shall not unreasonably burden public agencies to provide roads and streets, sewers, water, drainage, school improvements, and police and fire protection. Necessary infrastructure to support the proposed development would be funded and developed primarily by the Applicant and Connections Charter School.

Roads and Streets
Access to the campus will be through Edita Street, a 2-lane, 2-way public roadway. The project would not require a public agency to provide new roads to service the school. Further, results from the TIAR indicate that the increased traffic volume that could result from the proposed project would not require mitigative road improvements to manage the traffic increase.
Sewer and Water
The Kaʻūmana area is not served by a municipal wastewater system. Like all the surrounding properties, Connections would have to provide its own wastewater system as part of the project and would not require public agencies to provide sewer service.

The Property would be served by an existing 8” waterline in Edita Street. DWS potable water is available to the property, although the allocation is limited. To supplement the DWS allocation, the project proposes to implement an extensive rain catchment system to satisfy the school’s non-potable water needs. Every effort will be made to use catchment water to reduce potable water demand. Applicant acknowledges that the availability of potable water may limit the scope of development on the project site and that other sources of water may need to be found in order to develop the entire campus.

Drainage
The project includes features to minimize storm water runoff from the site. The rain catchment system would capture runoff from building roofs and covered walkways for reuse, which would reduce the amount of storm water runoff from the subject property. It may also be possible to capture and reuse storm water runoff from paved and ground surfaces for some non-potable uses, which could further reduce site runoff. These reuse options would be further explored in the project’s design phase. Runoff from paved areas would be managed on-site by a series of detention basins that would capture and hold runoff until it percolates into the ground and/or evaporates. The property has adequate land area that detention basins of sufficient number and size can be constructed to manage storm water runoff on-site such that there should be no net increase in runoff from the Property. During the design phase, further engineering studies would be conducted to develop adequate drainage plans, which would take into account any measures that might be needed, if any, to address potential flood hazards posed by the conditions along Edita Street. The project’s on-site drainage system would be designed in compliance with the county’s Storm Drainage Standards and is not expected to affect existing storm drainage facilities serving the region and would not burden public agencies to provide drainage improvements.

School Improvements
The proposed project is the development of a school facility. It would not require any public agency to undertake school improvements.

Police and Fire protection
The Property is located within existing service areas for both police and fire protection services. During the environmental assessment process, both the County of Hawai‘i Police and Fire departments were consulted. The Fire Department offered no comments and DWS indicated that the 8” waterline within Edita Street is adequate to provide the required 2,000 gallons per minute fire flow. The Police Department stated that they did not anticipate any significant impact to traffic and/or other public safety concerns related to the project. Thus, the project is not expected to unreasonably burden police or fire protection services.
16.4 Unusual conditions, trends, and needs have arisen since the district boundaries and regulations were established.

In 2001 the County of Hawai‘i Planning Department exempted charter schools from the requirement of obtaining a Special Permit. However, a lawsuit filed by the County in 2005 entitled, “County of Hawaii vs. Ala Loop Homeowners, et al,” Civil No. 03-1-0308, sought declaratory relief on the issue of whether the Wai‘ola Waters of Life Charter School, a public charter school, was required to obtain a Special Permit, pursuant to Sec. 205-6, HRS, prior to conducting a school or engaging in related activities. The Court ruled in Ala Loop’s favor, and ordered that pursuant to Sec. 205-6, HRS, the charter school had to obtain a Special Permit prior to operating within the State Land Use Agricultural District.

Pursuant to the Court’s ruling, the Applicant submits this Special Permit application to comply with this ruling.

Ka‘ūmanoa is one of the original suburbs of Hilo. Over the years, this upland neighborhood has grown in population and has slowly transitioned from a largely agricultural area to a rural residential neighborhood. Residential housing stock is mixed and varies from older plantation-era cottages to newer, upscale homes. Relatively newer growth in the region has come in the form of agricultural lot subdivisions, most notably the Sunrise Estates and Pacific Plantation subdivisions.

In 2004, the Puainako Street Extension was completed. One of the purposes of this road was to provide a more direct and safer route from Hilo town to the Saddle Road. One of the effects of constructing this road is that it opened up access to previously undeveloped land, thus facilitating future development of these areas. The first subdivision along the Puainako Street Extension, Hilo Hillside, was completed last year (2011). In recognition and guidance of these trends, and to direct residential expansion of Hilo into this area, the County of Hawaii in 2006 changed the LUPAG designation of the Property and surrounding areas from rural to low-density urban. With this slow ongoing shift away from a predominately agricultural and rural land use, an additional school facility would fill a public need for this growing area. A small school would be an unusual and reasonable use within the Agricultural District given the changes and anticipated development in the area.

16.5 The land upon which the proposed use is sought is unsuited for the uses permitted within the district.

The project site is located within an area covered by the 1880-1881 lava flow from Mauna Loa and soils are thin to non-existent. The poor soil conditions constrain the use of the property for highly productive agricultural cultivation. The project site is not classified by the ALISH system and is assigned a low productivity rating of D by the LSB. Thus, while agricultural use of the property is possible, it is not well-suited for highly productive agricultural pursuits.

Except for the roughly 20-acre area that would be developed for school facilities, the majority of the Property would still be utilized for uses permitted within the Agriculture District—agriculture and forestry. Despite the poor agricultural qualities of the property, the school does
intend to include an agricultural program, the purpose of which would be educational rather than commodity driven, and would focus on teaching sustainable practices. The school is looking at possibly implementing hydroponic techniques, which grow plants without soil and is well-suited to areas such as the Property, where the potential for conventional soil-based agriculture is poor. Roughly one-half of the lower parcel has been allocated for the agricultural use. Cultivated crops would include fruits and vegetables, native trees and plants, and ornamental plants. In addition to the agricultural uses, the school would like to have a small number of livestock and a future forestry/conservation program that would utilize the entire upper parcel and portions of the lower parcel, where pockets of native forest are located.

16.6 The proposed use will not substantially alter or change the essential character of the land and the present use. The Property currently is vacant, undeveloped and unused. The proposed project would change the undeveloped character of a portion of the property; however, the project generally would still be consistent with the expected use and character of land within the Agricultural District.

The school plans to implement a forestry/conservation program, which would use the upper parcel for reforestation projects and includes an elevated walkway through the ‘ō‘ia‘ia forest. Neither of these proposals would substantially alter nor change the existing use or character of this portion of the property.

School facilities, agricultural areas and areas designated for retention of native forest are proposed for the Property’s lower parcel. Some of the existing vegetation would have to be cleared or thinned in order to construct the school buildings and support facilities. Additional vegetation may also be cleared or thinned in areas targeted for cultivation. Clearing and thinning of existing vegetation and constructing facilities on the site would alter the present undeveloped character and use of the land. However, this change in the Property’s essential character and use to a small school and a supported agricultural program would be consistent with the expectations for land in the State Land Use Agricultural District and zoned Agriculture by the County.

16.7 The proposed use will not be contrary to the goals, policies and standards of the General Plan and other applicable documents such as community development plans and design plans.

The Applicant believes that the proposed use is compatible with the General Plan goals, policies, and standards, including those discussed below. Currently there is no Community Development Plan for the area in which the Property is located.

Economic
The General Plan indicates that it is the County of Hawai‘i’s policy to provide residents with opportunities to improve their quality of life through the development of economic opportunities that enhance the county’s various environments. The development of a charter school provides that fundamental first step of providing opportunities to improve the quality of life. The mission of the Charter School Network in Hawai‘i is providing academic choices for families and helping Hawai‘i deliver quality, student-centered education to the next generation. Charter schools
provide many special programs in science, math, Hawaiian language, project learning and arts, and this commitment to education will provide the next generation with a variety of economic opportunities, meeting the economic goal of the General Plan.

With the new campus, Connections intends to start a sustainable agriculture program and a forestry/conservation program. Both these programs would provide students with hands on, practical experience in these areas. This knowledge and experience could potentially lead to future career paths and economic opportunities that benefit not only the individual, but enhances their ability to contribute to the economic welfare of Hawai‘i County.

Energy
The General Plan indicates that it is the County of Hawaii’s policy to strive towards energy self-sufficiency. Connections plans to construct a “green” school and envisions that their new campus be a model of sustainable development and design. At a minimum, the school will achieve a Silver rating under the LEED Green Building Rating System, but will strive for a higher LEED certification if opportunities present themselves. The campus’ design would incorporate ways to reduce the school’s carbon footprint; proposed facilities would maximize natural ventilation and lighting through building orientation, architectural design features, and selection of appropriate building materials. Alternative and sustainable energy sources, such as wind and solar power, as well as sustainable strategies and technologies for water use, would be integrated wherever possible.

Environmental Quality
The General Plan indicates that it is the County of Hawaii’s policy to maintain and, if feasible, improve the existing environmental quality of this island. Connections intends that the new campus be a model of sustainability, thus minimizing its impact on the land and environment. Wherever feasible and allowable by applicable regulations, the campus conceptual plan calls for capturing and reusing rainwater and storm water runoff; biologically treating wastewater effluent and using recycled water; composting and recycling with the intention of reducing the amount of waste directed toward landfills; and reducing pollution associated with urban runoff and wastewater. The Applicant, as part of their overall educational goals would like to incorporate a sustainable agricultural program into their academic offerings and plans to implement a forestry/conservation program. Both of these programs would educate students on environmentally responsible management and maintenance of the land and use of environmental resources.

Natural Hazards
The General Plan indicates that it is the County of Hawaii’s policy to protect human life from hazardous natural events, reduce surface water and sediment runoff, and maximize soil and water conservation. Again, Connections plans to construct a green school and envisions the new campus be a model of sustainable development and design. At a minimum, the school will achieve a Silver rating under the LEED Green Building Rating System. To reduce surface water and sediment runoff, plans include capturing and reusing rainwater, and possibly runoff from paved areas. Fulfilling the campus’ non-potable water needs through reuse of rainwater, surface
runoff, and recycled water would maximize water conservation by using DWS-supplied water only where potable water is really needed. Water conservation would also be supported by the use of water efficient fixtures throughout the facilities. Storm water runoff from improved areas would be managed on-site such that the project should result in no net increase in runoff from the Property and should not exacerbate potential flood conditions in surrounding areas.

**Historic Sites**
The General Plan indicates that it is the County of Hawaii’s policy to protect and provide access to significant historic and cultural resources, as well as enhance the understanding of man’s place on the landscape by understanding the system of ahupua‘a. The Property is undeveloped and contains no historic structures. No archaeological, cultural sites or cultural practices are known to occur on the Property. The Property is located within the mauka, uplands portion of the ahupua‘a system. Connections’ intention is to incorporate a forestry/conservation program as part of their education curricula, which includes maintaining the existing native ʻōhiʻa forest with incorporation of reforestation projects. This program, as well as the entire sustainable theme to be carried throughout the campus design and the agricultural program, would serve as an educational tool to foster stewardship in caring for these mauka lands.

**Natural Beauty**
The General Plan indicates that it is the County of Hawaii’s policy to preserve, protect and enhance natural beauty and protect scenic vistas and view planes from being obstructed. Buildings would be single story, thus minimizing impacts to view planes. In addition Connections’ intends to preserve and protect the natural beauty of the Property by maintaining and enhancing the existing native ʻōhiʻa forest through the planned forestry/conservation program.

**Natural Resources**
The General Plan indicates that it is the County of Hawaii’s policy to protect and promote the prudent use of Hawaii’s unique environment and natural resources. Connections intention is that their new campus be a model of sustainability to serve as an educational tool that demonstrates the potential of alternative design and development options. The constraints posed by the Property—no access to a municipal wastewater system and limited allocation of municipal potable water—provide the opportunity to explore non-conventional and environmentally sustainable solutions. With the ample rainfall that occurs in Hilo, the school would like to use this water source, supplemented by recycled water, to minimize the demands on DWS-supplied potable water, thus helping to conserve this natural resource. With the planned forestry/conservation program, Connections’ would maintain much of the Property’s existing native forest resource, and work to enhance it by implementing reforestation projects in selected areas and replanting species such as koa and hapuʻu that historically grew in the area.

**Education**
The General Plan indicates that it is the County of Hawaii’s policy that facilities and programs are to be used to improve educational opportunities. The General Plan also states that sufficient
acreage be set aside for school facilities. The development of Connections Charter School meets the goal and objective the County General Plan for Education.

**Public Facilities**
The General Plan indicates that it is the County of Hawaii's policy to encourage the provision of public facilities that effectively service community and seek ways of improving public service through better and more functional facilities in keeping with the environment and aesthetic concerns of the community. Again, buildings are planned to be single story and oriented to take advantage of natural lighting and ventilation and are intended to be of lightweight construction similar to the surrounding residential area complimenting the environment and aesthetic concerns of the community.

**Energy-Solar Power**
The General Plan acknowledges the promotion and development of alternative energy resources. Connections plans to construct a green school and envisions that their new campus be a model of sustainable development and design. At a minimum, the school will achieve a Silver rating under the LEED Green Building Rating System. Some of the features of a LEED facility include the use of high-efficiency, unobtrusive, photovoltaic laminates (solar panels) placed on southern roof exposure and oriented at angles for maximum solar gain.

16.8 The proposed use is an unusual and reasonable use of land, which would not be contrary to the objectives to be sought by the Land Use Laws and Regulations, which, for the Agricultural and Rural Districts, seeks to preserve or keep lands of high agricultural potential in agricultural use.

While the Property is located within the State Land Use Agricultural District, the land does not have high agricultural potential. Because of its location within the 1880-1881 lava flow, soils covering the project site are generally too thin to support intensive agricultural cultivation. As a result, the Property is not classified by the ALISH system and has a LSB overall productivity rating of "D." A rating of "A" represents the highest productivity rating, and "E" the lowest. The site's rating of "D" places the property on the lower end of the agricultural productivity scale. Presently, the project site is overgrown, vacant, and undeveloped.

The proposed use of the Property is to accommodate school facilities that would support development of a sustainable agricultural program and a forestry/conservation program, and would be considered an unusual and reasonable use of land. The school would provide diverse educational opportunities for the children of east Hawai'i, and its incorporation of and use of the land for a sustainable agricultural program and forestry/conservation program would be consistent with the Property's State Land Use designation and zoning. Roughly 75 percent of the Property's land area would accommodate uses permitted within the Agricultural District. The project would not be taking lands of high agricultural potential out of agricultural use and would not be contrary to the objectives of the State Land Use laws and regulations. Rather, it would further the objectives of the various land use laws and regulations for the Agricultural District by converting vacant, unused land to productive agriculture.

DLNR Public Notice of Direct Lease
Public Notice - Direct Lease to Public Charter Schools

PUBLIC NOTICE
INTENTION TO DIRECT LEASE

Pursuant to Sections 171-16(c), Hawai‘i Revised Statutes, the Board of Land and Natural Resources hereby gives notice of its intent to lease 70.150 acres of State land situate at Poonahawai, Kukuau 2nd, South Hilo, Hawai‘i; and, identified as Tax Map Key: (3) 2-5-06:141 to the Connections New Century Public Charter School [§ 171-95.5]. This lease shall enable the lessee to utilize said parcel for its school.

Pursuant to Section 171-43, Hawaii Revised Statutes, and the minimum rent policy established by the Board at its meeting of May 13, 2005 under Agenda Item D-19, the annual rent will be set at $480.00.

Information related to this proposed direct lease may be reviewed during office hours at the Department of Land and Natural Resources, Land Division, 75 Aupuni Street, Rm #204, Hilo, Hawai‘i; and, at the offices of the Land Division on the Islands of Kaua‘i, Maui, and O‘ahu. Call or write to any of these offices to request information in an alternate format.

DONE at the office of the Department of Land and Natural Resources this 1st day of May, 2012.

Date of Publication: (Tuesday) May 1, 2012

Katherine Puana Kealoha, Esq., Director
Office of Environmental Quality Control
235 South Beretania Street, Suite 702
Honolulu, Hawai‘i 96813

Dear Ms. Kealoha,

Subject: Finding of No Significant Impact (FONSI) for Connections Public Charter School Master Plan, TMK (3) 2-5-006:141, South Hilo, Hawai‘i

The Department of Land and Natural Resources has reviewed the comments received during the thirty (30) day public comment period which began on August 23, 2010. The agency has determined that this project will not have significant environmental effects and has issued a FONSI. Please publish this notice in the next available OEQC Environmental Notice.

We have emailed a completed OEQC Publication Form to your office and submitted one hard copy and one .pdf format of the Final Environmental Assessment.

If there is anything we can help you with or if you have any questions, please do not hesitate to contact Charlene Unoki from my Land Division at 587-0433. Thank you.

Sincerely,

Laura H. Thielen
Chairperson

1.0 INTRODUCTION AND PROJECT SUMMARY

1.1 Project Profile

Project Name: Connections Public Charter School Campus Master Plan
Applicant: Connections Public Charter School
174 Kamehameha Ave
Hilo, Hawai‘i 96720
John L. Thatcher II, CEO

Approving Agency: State of Hawai‘i Department of Land and Natural Resources
EA Consultant: Wil Chee - Planning & Environmental
1018 Palm Drive
Honolulu, Hawai‘i 96814
Contact: Celina Shen

Tax Map Key: (3) 2-5-006:141
Land Area: 72.43 acres, more or less
Location: Ponahawai, Ka‘ūmanu, Kukuau 2nd, South Hilo
Land Owner: State of Hawai‘i (DLNR)
Existing Uses: Vacant
Proposed Uses: Pre-K through Grade 12 school

Land Use Classifications:
State Land Use: Agriculture
Hawaii County General Plan: Low Density Urban
Zoning: Agriculture 1-acre (A-1a)
Special Management Area: Project is not within the SMA

Anticipated Permits and Approvals:

* It is the school's intention to satisfy their water supply needs through a combination of the municipal water system, rain catchment water, and recycled water. If during design, it is determined that their water needs cannot be met through these sources, and that developing a well is needed to support the project, these permits and approvals would be needed.
1.2 Project Background

Connections Public Charter School (also referred to as “Connections”) was chartered by the State Board of Education in 2000, and authorized under signature of the Governor of the State of Hawai‘i, the President of the State Board of Education, and the State Superintendent of Schools. Connections opened in August 2000, with 184 students in grades K-6. By August 2001, the school had expanded to a K-12 program with a total of 360 students. The need and desire for this unique charter school is evidenced by an enrollment waiting list and is further illustrated by the broad-based community representation in the operation of the school.

The school’s faculty have been recognized for their innovative work, which has resulted in the school being designated as a “Demonstration Site” for the University of Hawai‘i Mānoa Curriculum Research and Development Group. This designation has resulted in Connections becoming a major clearinghouse for emerging curriculum, as well as a center for teacher development.

Connections is based in the Hilo area. Currently, the elementary and middle school is located in the Kress Building on Kamehameha Avenue in downtown Hilo. The Kress building is owned by the school’s affiliated non-profit organization. The high school is presently located in leased facilities at the Nani Mau Gardens, just outside of Hilo town. For the sake of long-term planning and budgeting, the school would prefer to not lease property from private owners. The desire to vacate the leased facilities in which the high school operates has provided the impetus to explore options for consolidating all of their academic programs at a single location. Consolidation provides an attractive option for management, operational, and financial reasons. Thus, began a search for suitable properties on which to develop new facilities for the school. In coordination with the State of Hawai‘i Department of Land and Natural Resources (DLNR), a property in Kāūmana was identified by the school as a potential site for the new campus. Subsequently, a master plan was prepared to guide development of the new campus that would co-locate its elementary, middle, and high schools on a single property and would allow for program expansion. Connections would like to add a sustainable agricultural program to their academic offerings. Also, at present, Connections does not have a pre-kindergarten program, but may choose to implement one in the future if demand exists and if adequate facilities can be provided. Connections is presently in the process of acquiring a long-term lease agreement for this property with DLNR.

1.2.1 Revised Draft Environmental Assessment (EA)

A Draft Environmental Assessment (EA) addressing the campus master plan was prepared and distributed for agency and public comment in August of 2009. Several comments were received on the Draft EA regarding potential impacts to Kāūmana Cave, a segment of which underlies portions of the subject property. After further research and review, it was determined that reconfiguring the campus plan to avoid Kāūmana Cave and any potential conflicts was prudent. A Revised Draft EA was prepared to analyze the potential impacts of the reconfigured campus plan. The Revised Draft EA was distributed for public and agency comment in August 2010. In this Final EA, the reconfigured campus plan is presented as the Proposed Action and the original campus plan is depicted as Alternative 1.
1.3 Scope and Authority
This EA has been prepared pursuant to Hawai‘i Revised Statutes (HRS), Chapter 343 (the EIS law) and associated Title 11, Chapter 200, Hawai‘i Administrative Rules (HAR), Department of Health (DOH), State of Hawai‘i. The use of State lands for the proposed action triggers the environmental review process under HRS Chapter 343. The intent of this EA is to ensure that comprehensive and systematic consideration is given to potential impacts of the proposed action upon the natural and man-made environment. Completion of the environmental review process pursuant to HRS Chapter 343 is required by DLNR prior to finalization of the long-term lease agreement referenced above.

This EA is intended to serve as an environmental disclosure document which identifies the purpose and need of the proposed action, reasonable implementation alternatives, existing environmental conditions, potential environmental impacts, and mitigation measures to avoid or minimize such impacts. The findings presented in this EA will provide the basis to determine whether an Environmental Impact Statement (EIS) or Finding of No Significant Impact (FONSI) is appropriate.

1.4 Proposed Action
The proposed action being evaluated in this EA is the conceptual master plan for a new school campus for Connections. The master plan would guide development of a new campus in Ka‘ūmana, South Hilo, Hawai‘i. The new campus would consolidate all of Connections’ existing academic programs at a single location, plus provide land area and facilities to expand their academic offerings. Facilities included in the master plan would accommodate the elementary, intermediate, and high school programs and supporting services; an agricultural program; a small dormitory facility; and a pre-Kindergarten (pre-K) program. The master plan proposes facilities to support approximately 380 K through grade 12 students, 30 non-traditional students, and 25 pre-K students.

1.5 Purpose and Need for the Proposed Action
The purpose of the proposed action is to relocate and establish a new school campus that would provide a long-term base of operations for Connections, and improve the quality of education the school can provide its students.

The action is needed because the school would like to better manage and operate their facilities by consolidating all of their academic programs at a single location. Further, a new location outside of downtown Hilo would provide an improved educational environment and the land area to expand their academic program. The need to find a new location for the high school precipitated the effort to consolidate their facilities. Development of a new campus with co-located school facilities would meet the following needs:

- Eliminate the high rental costs for the high school facilities.
- Provide space for a small dormitory (30-student maximum capacity).
- Provide the land area necessary to establish an agricultural program as part of the curriculum. Facilities needed to support the agricultural program include greenhouses, a horse barn, and land area for cultivation.

Building a new campus from the ground up would provide the opportunity to develop academic facilities that are tailored to Connections' specific educational philosophy and approach to teaching and learning, and would provide a unique learning environment for this multi-cultural, globally-oriented charter school.

1.6 Summary of Potential Impacts and Mitigation Measures
The Proposed Action is not expected to cause any significant adverse long-term impacts to the environment. However, potential short-term, temporary impacts could occur during the construction period. These include impacts on the acoustical environment, air quality, soils, fauna, and lava tube collapse. The following protective/mitigation measures would be implemented to minimize the potential for these short-term, temporary impacts.

**Acoustical Environment:** Construction activities that generate noise would be conducted in compliance with applicable regulations. If construction noise is expected to exceed the DOH's maximum permissible property line noise levels, a permit per HAR 11-46, *Community Noise Control*, would be obtained and additional mitigation measures could be imposed by DOH.

**Air Quality:** Construction activities would be conducted in compliance with all applicable air quality regulations, including provisions contained in HAR 11-60.1-33 *Fugitive Dust*. Construction site best management practices (BMPs) to minimize dust and emissions would be implemented. BMPs may include erection of dust screens around the construction site, frequent watering of unpaved roadways and bare areas, and paving and/or landscaping bare earth areas as soon as practicable, among other management practices.

**Soils and Surface Water:** Implementation of protective measures during construction would minimize any impacts on soils and reduce the potential for sediment-laden runoff to affect water resources. Typical measures include erosion control devices such as cut-off ditches, temporary ground cover vegetation, and various soil stabilization and protection materials. Adherence to construction site BMPs and conditions of the grading permit and NPDES permit should prevent any potential effects to soils and surface water.

**Fauna:** To reduce the potential for affecting Hawaiian hoary bats, it is recommended that clearing and grubbing not be undertaken during the birthing and pup rearing season. If clearing cannot be avoided during this period, it is recommended that a survey be conducted to verify if bats are present on-site.

To avoid disturbance to nesting Hawaiian Hawks, tree clearing should be avoided during the breeding season from March to September. If tree clearing must be conducted during this period, it is recommended that a survey be conducted to verify if any Hawaiian Hawks are present. If nesting activity is detected, consultation with the USFWS would be required.
prior to conducting further clearing activity within 500 meters of the nest tree.

To reduce the potential for affecting nocturnally flying Hawaiian Petrels and Newell’s Shearwaters with external lights and man-made structures, it is recommended that any external lighting be shielded.

Lava Tube Collapse: To minimize the potential hazard due to the collapse of an unknown lava tube that may be located within the project site, a geotechnical investigation should be performed for construction areas and appropriate measures employed to address site specific conditions. Such measures could include backfilling the lava tube; spanning the tube with girders or other means of support to minimize stress on the cave roof; or modifying the facility layout to avoid the lava tube altogether. If a lava tube should be encountered during construction, construction activity would be stopped and the proper authorities, including the Department of Land and Natural Resources would be contacted, so that an assessment can be made.

To avoid construction-related impacts to Kaūmana Cave, the cave’s alignment should be verified prior to initiating construction and delineating boundaries of the 100-foot buffer. During construction, the boundaries of the buffer zone should be clearly marked with brightly colored surveyor’s tape or similar. Construction personnel should be fully informed of Kaūmana Cave, adherence to the buffer zone, and the potential risk of working within vicinity of the cave. If, during construction on the lower parcel, an entrance to the inaccessible portion of Kaūmana Cave is found or inadvertently created, or if previously unknown segments of the Kaūmana Cave system are encountered, all construction activity in the vicinity of the find would cease immediately and the proper authorities, including the Department of Land and Natural Resources, contacted to assess the lava tube and its contents.

1.7 Unresolved Issues
This EA only addresses the conceptual master plan for the proposed school campus. Specific details of campus’ development would be determined during the project’s design phase. This includes details on the design and implementation of the proposed water and wastewater systems. If issues are encountered that warrant additional environmental review, a supplemental EA could be prepared, to address these specific issues or substantial deviations from the conceptual master plan.

1.8 Determination
Based on the information gathered during preparation of this EA, it is anticipated that the direct, indirect, and cumulative effects of the Proposed Action would not have a significant adverse effect on the natural or human environment. Consequently, the approving agency, the Department of Land and Natural Resources, has issued a Finding of No Significant Impact. Findings and determinations are discussed in further detail in Section 5.0.
2.0 DESCRIPTION OF THE PROPOSED ACTION AND ALTERNATIVES

2.1 Proposed Action (Preferred Alternative)

2.1.1 Project Location
The proposed project site is located in Kaūmana, South Hilo, on the eastern side of the Island of Hawai‘i. It is a vacant, undeveloped, state-owned parcel of land identified as Tax Map Key (TMK) (3)2-5-006:141 and is designated as Section 5(b) Ceded Lands. The project site is approximately 72.34 acres in size and is situated on Mauna Loa’s lower slopes, above Hilo town, and south of Kaūmana Drive (Figures 2-1 and 2-2).

The project site is separated into two parcels at its narrowest point by Edita Street. The upper parcel comprises approximately 37 acres, and the lower parcel 35 acres. The lower parcel is characterized largely by non-native trees and weeds and the upper parcel by a native ‘ōhi‘a forest with an understory of uluhe (Pacific false staghorn fern).

The majority of the property is situated within the ahupua‘a of Ponomawai, with a very small sliver along its southern edge falling within the ahupua‘a of Kukuau 2. The parcel is bounded along much of its perimeter by residences on Kaūmana Drive, Edita Street and Melemanu Street. Just west of the property, on the far side of Kaūmana Drive, is the main entrance to the Kaūmana lava tube complex, which has been designated as Kaūmana Caves County Park.

2.1.2 Project Features
The master plan addresses the incremental development of a new academic campus for the Connections Public Charter School. The campus master plan includes pre-K, elementary, intermediate, and high school facilities, and common facilities to support these programs. The master plan also provides facilities for an agricultural program, which Connections currently does not have, but would like to implement with the relocation to the Kaūmana property.

From an overall design concept, the proposed campus is intended to be a school within a forest. Planning and architectural design concepts take advantage of the site’s natural elements and aim to reduce disturbance to the natural surroundings, in particular the native ‘ōhi‘a forest that covers the upper parcel of the project site. Buildings would be small in scale and organized in clusters of single-story buildings to create a more village-like atmosphere, rather than a few large structures. Buildings would also be elevated off the ground to minimize the amount of grading and land modification necessary.

The proposed campus is described in further detail below, and the conceptual campus layout and site sections are shown in Figures 2-3 through 2-8.

**Lower Parcel**
All major school facilities are proposed to be located within the lower parcel. Major school facilities include the elementary, intermediate and high school classroom buildings, the administrative center, the library/resource center, the kitchen/dining facility, a gymnasium/multipurpose building, greenhouses, a 6-horse barn, a maintenance building, a 30-person dormitory, a
caretaker’s residence, and a pre-K building. Refer to Figure 2-5 for a site plan showing the locations of these individual facilities within the lower parcel. These facilities would support a projected 25 pre-K students, 167 elementary students, 107 intermediate students, and 107 high school students. The dormitory would serve a maximum of 30 non-traditional students. Connections envisions these non-traditional students to be visiting or exchange type students that would stay at the school for limited periods (e.g., 1 to 2 weeks at a time). Thus, the dormitories are not likely to be continuously occupied throughout the year.

As laid out, the school facilities nearest to the Kaūmanā Cave are located over 200 feet away. Buildings would be single story, small in scale and oriented to take advantage of natural lighting and ventilation. Buildings are intended to be of lightweight construction; most would be elevated off the ground and supported by shallow concrete pier foundations. The buildings are linked by a curved spine, which would primarily serve as a pedestrian mall, but would also be used as a service and emergency access road. The intention is to keep site grading to a minimum, but some grading would be required for roads, parking areas, some building pads, and to control surface runoff and drainage.

The campus would have a single vehicular access from Edita Street. Existing vegetation would either remain or be replanted with different varieties of trees to provide a visual buffer at the entrance of the access road, which would purposely limit visibility of the campus from Edita Street.

The access road would first lead to the campus’ main parking lot, which has a capacity of 88 stalls. The Pre-K program and the dormitory would be located to the north of the main parking lot. The dormitory would consist of two buildings, one for female occupants and one for males. The pre-K facility would have its own facility, including its own defined outdoor play area, that is located away from the elementary, intermediate and high school facilities. As mentioned earlier, Connections currently does not have a Pre-K program, but could implement one at some point in the future if there is sufficient interest. The Pre-K program is not a high priority item, and if implemented would likely be the last facility to be constructed at the project site.

At the end of the access road would be the vehicular roundabout. Surrounding the roundabout are the gymnasium/multi-purpose building to the west and the administrative center to the northeast. The gymnasium would be approximately 10,500 square feet and the administrative center about 3,000 square feet in size.

From the roundabout to the north is a branch road that leads to a secondary parking lot, which has a capacity of 52 parking stalls. This parking lot would mainly serve the high school students. The high school facilities are located in the northern part of the campus, adjacent to the high school parking lot. The high school consists of five classrooms; a faculty center; a media lab; the art, music, and science complex; two greenhouses, and a play field. Classrooms would be flexibly-designed so that they can be divided into smaller classrooms on an as needed basis. Close to the high school greenhouses are the horse barn and the maintenance shop. A small road

---

1 Parking lot design and stall counts are based on preliminary rough square footages. During the design development phase of the project, facility square footages will be better defined and stall counts would be adjusted as needed to comply with county code.
would connect the high school parking lot to the horse barn and a small loading and parking area would be provided to serve the barn.

Leading eastward from the roundabout is a curved pedestrian mall/service road that extends to the north of the campus. The path would mainly serve as a pedestrian mall; however, it would double as a service and emergency access road. A dedicated covered pedestrian walkway would run parallel to the mall. The mall would provide primary access to the elementary and intermediate school facilities, the kitchen/dining facility, and the library/resource center. The elementary school consists of seven classrooms, a media lab, and a faculty center; the intermediate school consists of four classrooms, a media lab, and a faculty center. Both the elementary and intermediate programs would share the same art and music classrooms, and the two greenhouses.

The overall layout of the campus is organized in a way that the schools’ classrooms and facilities are placed surrounding the common facilities, such as the library/resource center and the kitchen/dining facility. This layout would provide some level of separation between the elementary, intermediate, and high school programs, but also keep the facilities of the campus close together as a whole. The total gross square footage of the campus facilities would be approximately 90,000 square feet.

**Upper Parcel**

While no major school facilities are being proposed for the upper parcel, Connections would still like to use it to support their educational program. Thus, a walkway is being proposed for the upper parcel to provide access and viewing opportunities within the forested area. The walkway would not be constructed at grade, but elevated on posts, roughly 4 to 5 feet above grade. The walkway would be located beyond the 100-foot buffer surrounding the cave and would be a lightweight structure with shallow footings or pier foundations. Connections intends to fence off the property and will control access to the walkway and the upper parcel. This walkway is the only structure being proposed for the upper parcel.

For pedestrian safety, a painted crosswalk, including signage, would be delineated on Edita Street connecting the lower parcel driveway to the walkway entrance on the upper parcel.

Connections also intends to use portions of the upper parcel for reforestation projects. These projects would reintroduce, within the existing 'ōhi'a forest, some of the native species that historically grew in the area such as koa and hapu'u fern. It is currently estimated that roughly 20 acres of the upper parcel would be used for reforestation projects. This acreage is subject to change once on-the-ground conditions can be assessed and suitable reforestation areas identified.

**Sustainability**

Connections plans to construct a green school and envisions that their new campus be a model of sustainable development and design. At a minimum, the school will achieve a Silver rating under the Leadership in Energy and Environmental Design (LEED) Green Building Rating System, but will strive for a higher LEED certification if the opportunities present themselves and are economically feasible. The campus’ design would incorporate ways to reduce the school’s carbon footprint. Alternative and sustainable energy sources, such as wind and solar power, as
well as sustainable strategies and technologies for energy and water use, would be integrated wherever feasible. Examples of sustainable strategies and technologies for energy and water use being considered in the preliminary conceptual plans include the following:

- **Temperature Control** – Building orientation would help to regulate internal temperatures. The majority of buildings would be oriented to minimize morning and evening heat gain. South facades would be properly shaded using energy and heat reflection tools, such as strategically placed large eaves and overhangs, landscaping, light shelves, and vertical louvers. Roofs would be insulated and light in color to minimize heat absorption.

- **Air Movement** – Buildings would be constructed to maximize utilization of natural air movement for cross-ventilation, providing slightly larger air outlets than inlets, employing stack ventilation strategies and clerestory windows, cupola (barn), thermal chimneys, ridge vents, and ceiling fans.

- **Lighting** – North light would be maximized through the use of clerestory windows and glare minimized through the use of shading devices and large overhangs. Translucent structural roofing could also be used to provide additional natural light penetration.

- **Energy Production** – Use of high-efficiency, unobtrusive, photovoltaic laminates (solar panels) would be used, and southern roof exposure angles would be oriented for maximum solar gain.

- **Water Efficient Fixtures** – Use of water efficient fixtures such as waterless urinals, high efficiency toilets or low/dual-flush toilets would help reduce the potable water demand. Further reducing the demand for potable water would be the utilization of captured rainwater for toilet flushing.

- **Rainwater Collection** – The campus would include a rainwater collection system designed to capture rainwater from building rooftops for use in toilets, janitorial purposes, and for the needs of the agricultural program.

- **Use of Recycled Water** – Use of recycled water for irrigation and other non-potable water uses as allowed by applicable regulations.

**Landscaping**

For the upper parcel, no landscaping is proposed as it is Connections’ intention to maintain the existing native ‘ōhi‘a forest. For the lower parcel, minimal landscaping is proposed. Excluding the built-up and cultivated areas, the existing vegetation would serve as the primary landscape material. There could be some replacement of existing vegetation with other varieties of trees and shrubs, particularly near the Edita Street side of the lower parcel and along the driveway leading into the campus. As well, Connections intends to clear the evasive species growing within the lower parcel, which could be replaced with outplanted native species.

Where intentional landscaping would be provided, such as in the immediate vicinity of buildings, native plants that are well-suited to the localized environment and that require minimal maintenance would be used. There would also be some manicured, grassed areas such as the play fields.
Agricultural Program
With the new campus, Connections would like to incorporate an agricultural program into their academic offerings. The agricultural program would provide students with hands-on experience in sustainable agricultural practices and would emphasize small sustainable agricultural techniques. An area of approximately 17 acres is allocated for the agricultural/cultivation area. The agricultural area comprises the eastern portion of the lower parcel. Agricultural program facilities would include greenhouses, a 6-horse barn, and cultivated gardens. Cultivated gardens would be limited to the lower section of the property, which is currently populated largely by non-native trees and weeds. Cultivated crops may include vegetables, taro, fruit trees, native plants, and ornamental plants. The agricultural program may also include some livestock (e.g., chickens, goats, pigs, and horses).

Infrastructure
Electrical, telecommunication and potable water infrastructure is available to the project site. As stated earlier, the project will achieve, at a minimum, LEED Silver certification. A higher certification will be striven for, if financially feasible. Project features to achieve LEED certification would reduce demand for electricity and potable water. These include the use of photovoltaics and an extensive rainwater catchment system. To support the rainwater catchment system, a minimum of two cisterns or tanks—a catchment tank and a reservoir tank—would be needed. These tanks are shown conceptually on Figures 2-3 and 2-5. During design development the actual number and size of these tanks would be determined based on amount of captured rainfall to be collected and the amount of reserves needed to support the campus’ non-potable water uses.

The Ka‘u‘u area is not served by a municipal wastewater system. Therefore, like all the surrounding properties, Connections would have to provide its own wastewater system as part of the project. A biological wastewater treatment system is being considered and likely will be implemented for the school. One well-known and established system is called the “Living Machine.” This type of system is Connections’ preferred option over a conventional septic system. Biological treatment systems are on-site, environmentally friendly systems that mimic the cleansing functions of wetlands and consist of a settling tank and series of tanks/systems (underground or aboveground, depending on the specific design of the system) that progressively clean the wastewater. Bacteria, plants, and other organisms, such as snails and fish, are used to break down and digest the organic pollutants. It is an odor free process. The end product is R-2 quality water that can be reused for non-potable uses such as some agricultural irrigation or can be released safely back into the environment. On the campus site plan, an approximately 12,000-square-foot area has been set aside for the biological treatment system. This area is shown by the dashed rectangle on Figure 2-5. This area is based on early rough estimates of wastewater volumes. However, during design development, estimated volumes would be refined as they can be based on fixtures counts and also take into account water reduction features included in the project. Thus it is expected that this set aside area would be substantially smaller in size than what is shown on the conceptual master plan.

2.1.3 Project Phasing and Construction
Full build out of the new school is projected to be completed by the year 2022. However, the timetable for development is difficult to determine, as it is highly dependent on the ability of the
school to obtain the necessary financial resources. Given the amount of money required to develop the entire property and construct all of the school’s facilities, Connections proposes to develop the proposed project in phases, with each phase being initiated as funds become available. The sequence of each phase is based on a set of priorities developed by the school to meet its curriculum and operational needs. The proposed project phases and development schedule are presented below.

Phase 1 – Construction of agricultural facilities (2011)
Phase 2 – Construction of dormitory and caretakers residence (2012)
Phase 3 – Construction of high school facilities (2013).
Phase 4 – Construction of elementary/intermediate school facilities (2017-18).
Phase 5 – Construction of gymnasium (2019)
Phase 6 – Construction of pre-Kindergarten facilities (2022)

2.2 Alternatives Considered
In addition to the Proposed Action, No Action and three alternative design options were evaluated in the context of meeting the project’s purpose and need. The alternative design options incorporate different site utilization/layout configurations. The alternative designs are described in further detail below.

2.2.1 Alternative 1 (Linear Split Campus)
The Upper Campus would house the elementary and intermediate schools, the pre-K program, the main administration building, the main cafeteria and kitchen, and a gymnasium/multi-purpose building. The pre-K program will accommodate approximately 25 students, the elementary program 167 students, and the intermediate program 107 students. Of the 37 acres which comprise the Upper Campus, approximately seven acres would be built-up including roadways, parking and buildings.

As shown in Figure 2-10, facilities on the Upper Campus would be laid out linearly, stretching across the length of the property. Buildings will be situated along a pedestrian spine with the main administrative center, the gymnasium and the cafeteria/kitchen closest to the main parking lot and Edita Street. Further up the property will be the pre-Kindergarten facilities, followed by the elementary school facilities and the intermediate school facilities at the top of the Upper Campus.

The Upper Campus will have two driveways on Edita Street, which would provide the primary vehicular access to the Upper campus and would service the main parking lot. A secondary access is proposed off of Kaumana Drive at the upper tip of the property. This access would be limited (i.e., gated) and used primarily during the before and after school rush to accommodate traffic to/from the Puainako Extension and upper Kaumana Drive. It would also be used as secondary access/egress for emergency purposes. In addition to the main parking lot, four small parking lots would be provided to facilitate deliveries and service to the buildings located at the higher end of the Upper Campus.
The Lower Campus would house the high school, dormitory, agricultural program facilities, caretaker’s residence, grass field and a maintenance shop. The total built-up area, which includes roadway, parking, buildings and a grass field encompasses approximately 5.5 acres. An area of approximately 20 acres of the Lower Campus is allocated for the agricultural/cultivation area.

While the Upper Campus utilizes a linear layout, the Lower Campus is based on a centralized layout. A central courtyard scheme is used as the key site planning element and provides the focal area for outdoor activities and gathering. This pattern promotes campus security as the courtyard creates an enclosed and easily supervised space, where access can be controlled and activities monitored.

2.2.2 Alternative 2 (Centralized Split Campus)

Similar to the Alternative 1, Alternative 2 utilizes a split campus layout with the pre-K, elementary and intermediate programs located on the Upper Campus and the high school located on the Lower Campus. The total developed area of the campus would be approximately 33 acres consisting of an 18-acre Upper Campus and 15-acre Lower Campus (Figure 2-11).

Development on the Upper Campus is situated close to Edita Street and comprises approximately 18 developed acres. The Upper campus would have two driveways on Edita Street, which lead to the main parking area fronting the gymnasium and administration buildings. A service road that branches off from the eastern driveway and follows the property’s southeastern boundary would provide service access to the kitchen, the intermediate school’s facilities, the library, as well as two smaller parking areas.

The Upper Campus would accommodate the pre-K, the elementary and the intermediate schools. The main administrative office and faculty center would be located close to the drop-off area and main parking lot. Another main facility located at the entrance to the Upper Campus is the gymnasium. The cafeteria and main kitchen are located near the gymnasium connected by a large shared lanai. Close to the cafeteria are the intermediate school classrooms. Opposite the intermediate school, across the courtyard, are the elementary and pre-K classrooms. Located on the western side of the central courtyard are specialized classrooms and library/media resource center. These facilities are shared by the elementary and intermediate programs.

The Lower Campus would have a single driveway off of Edita Street, with two main parking lots fronting the school. A roundabout is provided to facilitate traffic flow and enhance the school’s sense of entry. A service roadway branches off from the main vehicular access, runs along the parcel’s northwestern boundary and would serve the kitchen, dormitory, caretaker cottage, and maintenance building.

The Lower Campus would accommodate the high school, dormitory, and agricultural program. The satellite administrative/faculty center is placed at the western side of the courtyard, fronting the drop-off and main parking. The classrooms are located on the southern side of the courtyard, while the library is situated on the eastern end. The cafeteria/kitchen and dormitory are placed on the northern side of the courtyard. The large land area east of the high school facilities is allocated for the agricultural program.
Under Alternative 2, all of the school facilities in both the Upper and Lower Campus’ enclose central courtyards, which would function as the gathering space for outdoor activities. Advantages of the centralized layout are that it can enhance security as access points can be controlled and outdoor activities can be easily monitored. Alternative 2 would require more intensive landscaping and would not provide as much buffer area between the school and the adjacent properties.

2.2.3 Alternative 3 (Consolidated Campus)
Alternative 3 adopts a more compact layout with the majority of the school’s facilities consolidated within the Upper Campus. All main functions including the elementary school, intermediate school, high school and dormitory are grouped together and located within the Upper Campus, while the agricultural program would be separated and placed within the Lower Campus. The total developed area of the campus would be approximately 23 acres consisting of a 20-acre Upper Campus and 3-acre Lower Campus (Figure 2-12).

Alternative 3 utilizes a central courtyard scheme. With the exception of the gymnasium, all facilities serve to delineate and enclose the central courtyard. This large courtyard provides a focal point for outdoor activities and a protected gathering space. The administrative/faculty center is located on the northeastern side of the courtyard, close to the drop-off and main parking lot, so it can function as the school’s access point. The elementary and intermediate schools, along with their shared specialized classrooms, form the northwestern edge of the courtyard. The library is placed on the western side of the courtyard. The high school classrooms are clustered along the southern side of the courtyard, while the dormitory facilities are located on the southeastern side. The cafeteria and kitchen are located on the eastern side of the courtyard between the dormitory and gymnasium.

The Upper Campus has one main vehicular access from the Edita Street. Two main parking lots front the school and traffic flow is facilitated by a roundabout, which also provides a drop-off area. A service roadway branches off from the lower parking lot and runs along the parcel’s southern boundary. This roadway and small parking lots provide service to the cafeteria, kitchen, dormitory, high school, and library/resource center.

The layout of the Lower campus is quite simple, with only a single structure and greenhouses to serve the agricultural program. The structure is located on the western end of the Lower Campus and is accessed by a roadway from Edita Street. A small parking lot is provided to service the agricultural program. The rest of the property is allocated for cultivation.

An advantage of the consolidated site layout is that it allows for more efficient development and would facilitate security and monitoring as the entire school would be accessed via a single entry point. However, a major disadvantage of this alternative is that it would require more intensive landscaping. The non-linear layout also would not provide a natural/forested buffer area resulting in the school’s buildings and facilities being situated much closer to adjacent private residential properties and public roadways.
2.2.4 Alternative 4 (No Action Alternative)
Under the no action alternative, Connections would continue to operate and house its elementary and intermediate schools in the Kress Building. The high school is currently located in facilities which must be vacated soon due to leasing issues. Thus, the school needs to find a new facilities to accommodate its high school operations. Once a new lease location is found, Connections would be faced with continued high rental costs in order to house its high school program. Additionally, the temporary nature and uncertainties associated with the leasing of a property could result in the interruption of services to its students and their families. Therefore, the No Action Alternative is not considered acceptable, as it would not meet the long term operational and curriculum needs for Connections.

2.3 Alternatives Considered and Eliminated from Further Analysis

2.3.1 Selection Criteria
In selecting a site for their new campus, Connections applied several selection criteria. Because the school’s long-term goals included adding an agricultural program, the property had to be large enough to accommodate an approximately 20-acre cultivation area. The University of Hawai‘i at Hilo has a 20-acre demonstration farm, thus twenty acres was identified as a target size for Connection’s demonstration farm. Therefore, the property needed to have enough acreage to accommodate school facilities plus provide another roughly 20 acres for cultivation. Other criteria included surrounding land uses that are compatible with a school and the agricultural program; sufficient vehicle access, while staying away from major roadways; availability of public transportation, and availability of utilities.

2.3.2 Alternative Site Locations
The applicant does not own another suitable site and the land costs involved in acquiring a suitable site could be very high considering the current market. Connections conducted an extensive search of possible properties on which to develop a new school campus and found that the Ka‘ūmana project site was the only acceptable site within the school’s service area that satisfied its selection criteria. In addition, the Ka‘ūmana project site was uniquely suited to support both an agricultural program and a conservation/forestry program.

Connections engaged DLNR to discuss the possibility of leasing state land on which to develop their new campus. DLNR forwarded a list of properties in the Hilo area for consideration by the school. Table 2-1 below lists the properties that were considered, but rejected because they did not meet the school’s needs.

2.3.3 Deferred Action

This alternative would delay the process of identifying, securing, and developing a site for the construction of a new campus. This would delay the lease agreement process and in turn, delay the transfer of the proposed project site to the Applicant. In addition, there would likely be an increase in planning, design, and construction costs in the future that would be financially burdensome for the applicant and could potentially preclude development of a new campus altogether.

This Page is Intentionally Blank.
This Page is Intentionally Blank.
3.0 AFFECTED ENVIRONMENT, POTENTIAL ENVIRONMENTAL
CONSEQUENCES AND MITIGATION

3.1. Topography, Geology, and Soils

**Topography**

Hilo is nestled at the end of an ocean bay where young lava flows from Mauna Loa meet older flows from Mauna Kea. Overall, the area slopes toward the sea and towards the region where the Mauna Kea and Mauna Loa lava flows meet. Superimposed on the slopes are the undulating topographic highs and lows typical of lava flows.

Elevations within the project site range from 600 to 750 feet above mean sea level (msl) in the lower (eastern) parcel and 750 to 900 feet above msl in the upper (western) parcel. The terrain gently slopes from southwest to northeast. The project site has an average slope of 6.13 percent.

**Geology**

The areas above Hilo have been covered by successive lava flows from Mauna Loa, some of which have in-filled the area between the slopes of Mauna Loa and Mauna Kea. The project site rests entirely on lands covered by the 1880-1881 Mauna Loa lava flow. This narrow tongue of pāhoehoe lava originated on the slopes of Mauna Loa and flowed northeasterly toward Hilo, halting just two miles short of the town. The lavas of the 1880-1881 flow are Kau Basalts and consist of relatively smooth, glassy surfaced pāhoehoe that has been distorted by uplifts and pressure fractures (Wolfe & Morris, 1996).

Portions of the project site are underlain by a lava tube segment that is part of the Kaʻūmana Cave system. Kaʻūmana Cave is discussed in greater detail in Section 3.2 below. Lava tubes develop as underground conduits of magma within a lava flow transports the molten magma for long distances (USGS, 1995). As the molten pāhoehoe surface flows cool and crust over forming a hardened outer surface layer, the more insulated, hotter middle portions of the flow continue to move down hill beneath the solidified crust. As the supply of fluid magma decreases, the level of its residual subsurface flow gradually drops as it drains from its primary pathways. What remains are pockets of open space between a ceiling and floor of solidified magma, forming underground cavities and sinuous caverns. Aside from Kaʻūmana Cave, it is possible that there may be other unknown lava tubes that underlie the project site.

**Soils**

Soils covering the project site are thin to nonexistent because the area was covered with lava basalt flows only 128 years ago. The majority of soil within the project area is classified as pāhoehoe lava flow (rLW) with only a small area in the northernmost portion of the site being comprised of keāukaha rocky muck (rKFD) (Sato, et al., 1973) (refer to Figure 3-1).

New pāhoehoe has a glassy, smooth surface and a high porosity that allows water to quickly percolate underground. These are not ideal conditions for soil formation. Soil slowly develops by the breakdown of vegetation and lava debris, which form small pockets of soil in cracks and crevices. Over time, as more soil slowly forms and accumulates, dense vegetation consisting of
trees, ‘ōhelo berry, a‘ali‘i and Pacific false stag horn or ‘uluhe will develop in areas with high precipitation (Sato, et al., 1973).

The Keaukaha Rocky Muck soils in the northern portion of the site are well-drained, thin organic soils that overlay the pāhoehoe lava bedrock. A typical profile contains soils that are dark in color and acidic due to the accumulation of decomposing vegetation and high rainfall (Sato, et al., 1973). The soil covering the pāhoehoe lava is rapidly permeable, runoff is medium and the erosion hazard is slight.

3.1.1. Potential Impacts

PROPOSED ACTION

During construction activities such as clearing, grading, and excavation for utility and drainage improvements, soils and topography would be altered in the areas to be developed. Exposed soils are susceptible to erosion, especially during periods of heavy rain. Wind erosion can also result in some unavoidable and negligible loss of soil. Silty runoff is another possible impact that requires mitigation. All of these disturbances would be localized, short-term, and temporary.

Prior to construction activities the contractor would develop and implement a site-specific best management practices (BMP) plan that would identify the most effective erosion, sedimentation, runoff and dust control measures to reduce the amount of soil and sediment transport from construction activities. With adherence to BMPs, no significant adverse short-term, direct or indirect impacts to topography or soils are anticipated as a result of the Proposed Action.

The risk of damage to school facilities and injury to construction workers and school personnel caused by lava tube roof collapse would be minimized by siting and limiting major development to an area of the lower parcel that is not underlain by known lava tubes. Precautionary measures would be implemented, as warranted, to minimize the potential for encountering unknown voids in areas slated for development.

In the long-term, Connection’s building design concept would minimize the disruption of soils and topography at the project site. The project would incorporate and maximize the use of the existing natural landscape into the campus design, leaving much of the site undisturbed. From a conceptual approach, the design involves the construction of small-scale, elevated structures supported by shallow concrete pier foundations (Figures 2-6 through 2-8). Use of the concrete pier foundations will keep floor elevations above the existing grade and will greatly minimize disturbance to soils and topography.

ALTERNATIVES

For all alternatives, the potential impacts to topography and soils would be similar to the Proposed Action. The only difference is that areas on both the upper and lower parcels would be disturbed, thus resulting in a greater surface area that is disrupted. Under the No Action alternative, topography and soils would not be affected.

3.1.2 Mitigation Measures

Where warranted, site-specific geotechnical surveys would be conducted to determine the potential for subsurface voids beneath areas to be developed. If subsurface voids are identified,
an engineering solution could be applied to allow construction over the void or the siting of the structure could be adjusted to keep away from the void altogether.

If any segment of a lava tube should be encountered during construction, construction activity would be stopped and the proper authorities, including the Department of Land and Natural Resources would be contacted, so that an assessment can be made.

Implementation of protective measures during construction would minimize any impacts on topography, geology and soils. Typical measures include erosion control devices such as cut-off ditches, temporary ground cover vegetation, and various soil stabilization and protection materials.

3.2 Kaūmana Cave

Kaūmana Cave is a lava tube cave that formed during the 1880-1881 eruption of Mauna Loa (USGS, 1997 and 1995). There is some discrepancy in the literature regarding the length of Kaūmana Cave. The author of The World’s Longest Lava Tube Caves provides a total length of 2,544 meters (1.58 miles), though admits that this length is underestimated (Crawford, n.d.). Despite these discrepancies in the estimated length, only a small segment of Kaūmana Cave underlies the proposed project site, and is directly relevant to this project. Refer to Figures 2-3 through 2-5 to see the alignment of Kaūmana Cave, as it relates to the project site and the proposed campus plan.

The depth of Kaumana Cave, as a whole, averages 12 feet below ground surface. This estimate was provided in a technical report conducted in 1967 by von Seggern and Adams, in which the accuracy of electromagnetic mapping of Hawaiian lava tubes was tested using Kaūmana Cave as a case study. von Seggern and Adams used data provided by H.T. Stearns and G.A. Macdonald from a 1946 study involving Kaūmana Cave, in which they state that Kaūmana Cave has an “areal extent as 24 square miles and its estimated volume as 3 x 10^8 cubic yards, implying an average thickness of 12 feet” (von Seggern & Adams, 1967, p. 18). Through their study, von Seggern and Adams (1967) estimated the thickness of the ground between Kaūmana Cave and the surface in three widely-separated locations and found the thickness to be 24 feet, 24 feet, and 27 feet respectively. von Seggern and Adams (1967) concluded that the average depth of 12 feet for Kaūmana Cave, as provided by Stearns and Macdonald, may still be correct if the flanks of the flow are closer to the ground surface than the lava tube itself. However, the average depth of Kaūmana Cave, according to their observations was between 24 and 27 feet. Based on more recent surveys, some researchers believe the roof thickness of the cave could be as little as 5 to 10 feet in some places (P. Kambesis and Dr. F. Stone, letters dated September 3, 2009 and September 4, 2009, respectively).

The only legal access to Kaūmana Cave is through a collapsed skylight in a county park that is located west of the project site, across Kaūmana Drive. A stairway was built to provide public access into the cave. From the entrance in the county park, Kaūmana Cave extends both upslope and downslope. The downslope portion crosses beneath Kaūmana Drive, runs below a handful of residences along Kaūmana Drive, and continues downslope under the upper parcel of the project site. This segment of Kaūmana Cave ends at Edita Street, which separates the upper and
lower parcels of the project site. At Edita Street, there is another opening to the cave. This opening is artificial, having been created during the construction of Edita Street. Metal bars were placed across the opening to prevent entry or exit at Edita Street; however, the bars have been vandalized and bent to allow a person to squeeze into the cave (Stone, 1992). Unauthorized access to the cave at this location is in violation of the Hawai‘i Cave Protection Law, which requires written consent from the property owner prior to entry into a cave (the Hawai‘i Cave Protection Law is discussed further below). The length and alignment of this cave segment has been documented. The most recent known surveys were conducted in 1992 by Island Survey, Inc. for the Puainako Street Extension and Widening project (Okahara and Associates, 2000) and the Hawaii Speleological Survey in 1993 (Halliday, 1997).

Ka‘ūmana Cave does extend downslope of Edita Street; however, this portion of the cave is believed to be inaccessible. When Edita Street was built in the 1950s, the cave was truncated and portions of the roof deliberately collapsed, thus preventing access to the portion of the cave downslope of Edita Street. The majority of this cave segment underlies the properties located directly northwest of the project site’s lower parcel. A small segment of the cave likely crosses the northernmost corner of the lower parcel.

This lower segment of the cave was mapped during a 1953 cave expedition conducted by members of the Hilo Lions Club. They explored 4,700 feet of the lava tube, from the main entrance at the county park until passage through the cave was no longer possible, including the approximately 1,200 feet of the cave below Edita Street, which is no longer accessible. The Lions Club members produced a map of this expedition, which provides the location and dimensions of Ka‘ūmana Cave, as well as descriptions of the cave’s characteristics (Halliday, 1997). This map served as the basis for the cave alignment across the lower parcel shown in Figures 2-3 and 2-5. As stated previously, there are no known entrances into the lower segment of cave, and it appears that members of the Hilo Lions Club were the last persons known to document this segment of the cave.

Ka‘ūmana Cave provides many resources to those interested in the unique attributes and ecological characteristics of lava tubes. It provides educational and recreational opportunities; and research opportunities for biologists, speleologists, volcanologists, hydrologists, and geologists. Ka‘ūmana Cave is visited by members of the local population; scholars and speleologists in the global community; as well as tourists visiting the Hilo area. Ka‘ūmana Cave can provide an important contribution to the understanding of adaptation and survival of cave invertebrates. Some educators recommend taking students on field trips to the cave for educational fieldwork, and using the cave’s resources for long-term scientific studies.

The biological characteristics of Ka‘ūmana Cave were examined by Dr. Fred Stone in 1992 for an environmental impact statement conducted for the Puainako Street Extension and Widening project EIS (Okahara and Associates, 1993). During this biological survey, Dr. Stone addressed the close relationship that cave organisms have with the roots of the ‘ōhi’a trees that grow into the lava tube. In Hawaii’s lava tubes, tree roots are often the primary source of water and nutrients for cave flora and fauna (Howarth, 1972). In Ka‘ūmana Cave, the roots of ‘ōhi’a trees play an important role in the cave ecosystem. Sections of the cave with a low level of biodiversity coincide with areas devoid of ‘ōhi’a tree roots—areas where the trees have been cleared at the
surface (Stone, 1992). Dr. Stone’s 1992 study identified more than 15 species of endemic cave invertebrates that have colonized Kāʻūmāna Cave. More recently, Dr. Francis Howarth in a letter dated September 4, 2009 has indicated that there are several noteworthy species within Kāʻūmāna Cave, including crickets, moths, and planthoppers, among others. Two of these species—the Hawaiʻi cave water treater (Cavaticovelis aea) and the Hawaiʻi cave rock cricket (Caconemobius varius)—are listed by the USFWS as species of concern. In addition, there are microorganisms that grow on the cave’s walls. Otherwise known as “cave slime,” these microorganisms are of scientific interest to microbiologists and other researchers (Dr. F. Stone and Dr. P. Boston, letters dated September 4, 2009 and September 6, 2009, respectively).

Currently, portions of Kāʻūmāna Cave are used, or have been used, as illegal dump sites. Common household garbage, automobile waste, agricultural waste, pesticides, raw sewage, and other varieties of waste have been observed in the lava tube (Halliday, 1999 and 2003). The best-known garbage dump is located just downslope from Kilua Street. In spite of the fact that there are no documented dump sites directly beneath the upper parcel, flood can water push debris from the upslope areas of the cave toward the segment that underlies the upper parcel of the project site. Halliday (2003) suggested that as flood waters move through the cave, it is possible that residual products from illegal dump sites may be present in flood waters that exit Kāʻūmāna Cave on Edita Street.

Cave Protection Law - In 2002, the State of Hawaiʻi passed the Hawaiʻi Cave Protection Law. Amended in 2008 and included in the HRS as Chapter 6D, the Hawaiʻi Cave Protection Law defines how caves are to be protected, what types of actions and resources warrant state intervention, and the responsibilities of landowners who have caves on their property. Among other pertinent inclusions in the Hawaiʻi Cave Protection Law, the following sections are relevant to Kāʻūmāna Cave, as it relates to this project:

- §6D–2 prohibits any person from intentionally, knowingly, or recklessly breaking, harming, or damaging caves, their surfaces, or the resources within the cave.
- §6D–3 prohibits any person from dumping waste, garbage, litter, sewage, or toxic substances into a cave. However, new septic systems are permitted in proximity to caves, if they are installed with solid tanks and surface leach fields that prevent sewage from flowing into the cave.
- §6D–4 prohibits the disturbance of native organisms in a cave. This section also ensures that surface activities on the land above a cave shall not be prohibited or constrained in any way by inclusion of this section.
- §6D–7 prohibits entry into a cave, by any person, without prior written consent from the property owner. The segment of Kāʻūmāna Cave that underlies the project site is owned by the State of Hawaiʻi, Department of Land and Natural Resources.

Development of surface lands situated above known caves and lava tubes are not necessarily prohibited under Hawaiʻi’s Cave Protection Law. Further, provisions of the cave protection law do not apply to caves inadvertently encountered during the normal course of construction activities, provided that any protection and mitigation measures identified during the HRS 343 environmental review and land use permitting conditions are followed.
3.2.1 Potential Impacts

**PROPOSED ACTION**
The Proposed Action is not expected to result in any short or long-term adverse impacts on Kaūmāna Cave, including any biological or cultural resources contained within. A 100-foot protective buffer, as measured from the outer edges of the cave, would be observed. In Dr. Stone’s 1992 Kaūmāna Cave Report, a minimum 50-foot buffer was recommended for the road extension and widening project to maintain the cave’s structural integrity. However, the County of Hawai‘i Department of Public Works and the U.S. Fish and Wildlife Service determined that a buffer of 15 feet was sufficient to avoid impacting the cave. For its campus master plan, Connections has chosen to maintain a larger 100-foot buffer to ensure the safety of construction workers and users of the school campus, and to minimize the potential for any adverse impacts to the cave.

With adherence to the 100-foot buffer, it is expected that the natural, educational, recreational, and historical resources of Kaūmāna Cave would be preserved. On the upper parcel, the only structure proposed is an elevated walkway that would be located beyond the 100-foot buffer and would be a lightweight structure with shallow footings or pier foundations. While some selective felling of ‘ōhi‘a may be needed to construct the walkway, the number of trees cleared would be kept to a minimum. Further, the trees that may be cleared would be outside of the 100-foot buffer and would not affect the underlying ecosystem Kaūmāna Cave, of which the ‘ōhi‘a roots are a significant component. The Proposed Action intends to preserve the native ‘ōhi‘a forest in situ, maintaining their habitat and the roots that grow into the lava tube. On the lower parcel, major school facilities nearest to the cave would be located over 200 feet away, well outside the 100-protective buffer.

Based on the master plan and vision for Connections, restoring and maintaining a pristine natural environment is very important to the school. The proposed project aims to maintain and improve the native tree population on the property, thereby minimizing disturbance to the native habitat for the ground-level ecosystem, or those dependent on the ‘ōhi‘a tree roots in Kaūmāna Cave.

Under the Proposed Action, Connections would lease the property from the State of Hawai‘i, Department of Land and Natural Resources. If Connections is successful in securing a long-term lease with DLNR, either DLNR or the Board of Land and Natural Resources would retain the right to grant entry to the portion of the cave that underlies state property. However, DLNR has indicated that if a request for entry were made, it would consult with Connections, as the property’s lessee, to ensure that the activity(ies) for which entry is being requested, would not interfere with Connections’ operations or educational programs. It should be noted that Connections has no intention of restricting the learning and research opportunities of others in relation to Kaūmāna Cave.

**ALTERNATIVES**
Alternatives 1, 2 and 3 could potentially result in significant impacts to Kaūmāna Cave. While the site layouts vary, all three alternatives proposed constructing buildings on the upper parcel, directly above Kaūmāna Cave. Constructing over the known lava tube cave subjects the Proposed Action to safety hazards from potential collapse of the cave during construction and during operation of the school. To safely construct over the Kaūmāna Cave, these alternatives
could require an engineering solution to design a structural foundation that spans the lava tube or concrete piers may be required to pierce the cave roof to reach stable bedrock on the cave floor. In additional, these alternatives would required clearing some of the ‘ōhi‘a trees above the cave, which could have significant indirect effects to the cave ecosystem.

The No Action alternative would result in no impact on Kaūmana Cave.

3.2.2 Mitigation Measures
Although the Proposed Action limits all construction to beyond the 100-foot buffer zone, the following additional protective measures should be undertaken. The cave alignment should be verified prior to initiating construction and delineating boundaries of the 100-foot buffer. During construction, the boundaries of the buffer zone should be clearly marked with brightly colored surveyors tape or similar. Construction personnel should be fully informed of Kaūmana Cave, adherence to the buffer zone, and the potential risk of working within vicinity of the cave.

If, during construction on the lower parcel, an entrance to the inaccessible portion of Kaūmana Cave is found or inadvertently created, or if previously unknown segments of the Kaūmana Cave system are encountered, all construction activity in the vicinity of the find would cease immediately and the proper authorities, including the Department of Land and Natural Resources, contacted to assess the lava tube and its contents.

3.3 Hydrology, Surface Water, and Groundwater
Rainfall is abundant in the Hilo area, with the project area receiving between 160 and 200 inches of rain annually (Juvik and Juvik, 1998). Much of the rainfall percolates into the ground, recharging the underground aquifers. During periods of heavy precipitation, runoff can be problematic if the amount and rate of runoff exceeds the percolation rate of the underlying ground surface.

Surface Water
There are no perennial streams, lakes or ponds within the project site or in the immediate vicinity. The nearest perennial stream is Waipahoe Stream, which flows north of the project site and feeds into the Wailoa River. There is topographical evidence that indicates the presence of an intermittent stream south of the lower parcel that drains towards Alenaio Stream. Runoff that flows through Kaūmana Cave to the concrete channel along Edita Street feeds into this intermittent stream. Inland waters in the vicinity of the project site are designated as class 2 waters and the nearest marine water to the project site is Hilo Bay, which is designated as class A waters.

Groundwater
The project site is located within the Northeast Mauna Loa Aquifer Recharge Zone (Juvik and Juvik, 1998). With the highly permeable pāhoehoe flows, which are characteristic of the project site, precipitation quickly percolates into the ground where it recharges this aquifer resource. The Mauna Loa Aquifer Recharge Zone provides a sustainable yield of approximately 740 million gallons per day (gpd) of fresh water for the residents, forests, and ecosystems within the zone, including the town of Hilo and surrounding area.
Kaūmana Cave

Given the high level of annual rainfall in the Hilo area, there does exist the potential for the presence of stream water in the Kaūmana cave system throughout the year, although water is not present in the cave at all times. Halliday notes that, “the lower 2.2 km of this cave (from Kilua Road to Editas Street) lacks stream flow unless rainfall exceeds ~20 cm within a period of 2-3 days: a common occurrence in all seasons” (2003, p. 72) and that, “in periods of normal rainfall, running water sometimes is audible beneath the floor of this section of the cave” (2003, p. 72).

Contrary to some of the literature, lava tubes do not generally function as groundwater conduits. Halliday notes that “groundwater conduit flow is almost exclusively a floodwater phenomenon” (2003, p. 72). In this same article, Halliday notes that Kaūmana Cave is a known conduit for floodwaters, and debris transported by floodwaters has been observed several meters above the floor of the cave, indicating that water levels in the cave have the potential to rise several meters above the cave floor (2003 and 1999). Flooding is caused both by natural seepage through the cave walls and surface runoff that is diverted from the upper parts of Kaūmana Drive into the cave. Floodwaters in Kaūmana Cave emerge at the Editas Street opening, where it flows into a concrete channel that runs parallel and adjacent to Editas Street. From this channel, water passes under Editas Street through a culvert and discharges into the intermittent stream discussed above. During severe storm events, the concrete channel has been known to overtop and flood Editas Street. Risk and impacts from flooding is addressed in Section 3.4. Intensive flooding from a record-breaking rainfall in 2000 caused the cave to overflow through a ceiling vent upslope from the project site (Halliday, 2003), which also indicates that, on occasion floodwater can reach extremely high levels in the cave.

3.3.1 Potential Impacts

Proposed Action

There are no anticipated long-term impacts to hydrology, surface water or groundwater resulting from the Proposed Action. As a result of the Proposed Action, there would be an increase in impermeable surfaces, thereby increasing the amount of surface runoff. However, final engineering plans for the site would include site drainage plans that provide swales or drain inlets that direct runoff from newly paved areas into detention basins or drywells, where it would be retained until it percolates into the ground. The Proposed Action would be implemented in compliance with applicable the regulations contained in HAR 11-54 and meet the criteria set forth in the antidegradation policy (HAR 11-54-1.1), designated uses (HAR 11-54-3), and water quality criteria (HAR 11-54-4 through 11-54-8). Any discharges of wastewater or stormwater into State surface waters would obtain the necessary National Pollution Discharge Elimination System (NPDES) permit in accordance with HAR 11-55. A rain catchment system for roof runoff would be implemented, which would help reduce the amount of surface runoff. If warranted, site engineering plans may also need to accommodate potential flood water exiting Kaūmana Cave at Editas Street. Potential storm drainage impacts are addressed in Section 3.4.

The construction contractor would develop and implement a site-specific BMP plan to minimize potential impacts to ground and surface water sources during construction. Required permits such as a County of Hawai‘i grading permit and a NPDES permit for construction-related storm water discharge would also impose permit conditions, which must be adhered to by the
construction contractor.

**ALTERNATIVES**
Similar to the Proposed Action, Alternatives 1, 2 and 3 would not adversely affect surface or groundwater resources. The No Action alternative would have no affect on the existing ground or surface waters in the area.

**3.3.2 Mitigation Measures**
No mitigation is warranted or proposed. Adherence to applicable regulations, construction site BMPs and conditions of the grading permit and NPDES permit should prevent any potential effects to hydrology, surface water and ground water.

**3.4 Natural Hazards**

*Flood Hazards*
Flood events on the Island of Hawai‘i are generally associated with severe rainstorms, storm surge, or tsunami inundation. The island is geologically young, and in many areas enough time has not passed for the formation of defined watercourses. Poorly defined watercourses often flow and overflow during storm events. The South Hilo district is particularly impacted by this problem due to high amounts of rainfall. The Federal Emergency Management Agency (FEMA) has classified the area in which the project site is located, as Zone X. Zone X are lands with no recognized flood potential and are located outside both the 100-year and 500-year floodplain. This classification means that the project site is located outside of the 0.2 percent annual chance floodplain, and that no base flood elevations or depths are shown for this zone (NFIP, 2009). The risk of flooding from large surface water flood events is low.

Although the risk is low, there is hazard from large, infrequently occurring flood events from water discharged from Kaumana Cave. Water that naturally seeps into Kaumana Cave during periods of high rainfall along with surface runoff from the upper regions of Kaumana Drive that are diverted into Kaumana Cave can create flood conditions. As flood waters are channeled through Kaumana Cave, as has been noted by Halliday (2003 and 1999), there is potential that the water volume could be high enough to exit the cave system through the opening on Edita Street, as noted by Stone (1992) and Halliday (2003 and 1999). From the Edita Street exit, storm water then flows through a concrete channel running parallel to, and alongside Edita Street, where it is directed into a culvert underneath the road and into an intermittent stream that borders the lower parcel’s southern boundary. During severe storms, water has been known to overtop the concrete channel and flow across Edita Street, thus creating a flood risk for the project site, as well as for the surrounding neighborhood.

*Volcanic Hazards*
The Island of Hawai‘i was developed from the eruptions of five volcanoes: Kohala, Hualalai, Mauna Kea, Mauna Loa, and Kilauea. Of these, Mauna Loa and Kilauea are active today. Hilo is located just 30 miles north of Kilauea, and is situated in the saddle zone between Mauna Kea and Mauna Loa. The saddle zone on the eastern flanks of these two volcanoes is a natural dip in the topography of the island created from overlapping lava flows from their historic eruptions. This topographic dip increases the probability that lava flows originating from the northeastern rift
zone of Mauna Loa would flow toward the South Hilo area, because lava, like other liquids, flows downhill and towards the path of least resistance.

The project site is located on lava fields from the 1880-1881 eruption of Mauna Loa. This 128-year-old flow is the nearest to Hilo that lava from Mauna Loa has come for over 1,000 years (USGS, 1995). Lava flowing toward Hilo during the 1880-1881 eruption was not a unique occurrence. In recent history, lava originating on the northeastern flanks of Mauna Loa has followed this course several times. The 1855, 1880, 1935, 1942, and 1984 eruptions from Mauna Loa have all sent lava flowing toward Hilo (Wolfe & Morris, 2005; Stearns, 1966). Figure 3-3 shows the historic lava flow paths from eruptions occurring between 1843 and 1984.

Nine lava-flow hazard zones have been delineated on the island of Hawai‘i to provide a quick assessment of a parcel’s risk to exposure and damage from lava. These zones are based on historical eruption patterns and geologic mapping of older flows on the volcanoes’ flanks. According to the United States Geological Survey (USGS), much of South Hilo is contained in Lava Flow Hazard Zone 3, which consists of areas that have had 15 to 75 percent of their surface covered by lava in the last 750 years, and 1 to 5 percent of their surface covered by lava since 1800. On a scale of ascending risk, Zone 3 lands are less hazardous than Zone 2 lands, which designate areas directly adjacent to and downslope of active rift zones (USGS, 1991; Heliker 1990). The project site, as well as all the surrounding development and most of Hilo, is located in Lava Flow Hazard Zone 3. Refer to Figure 3-4 for the Lava Flow Hazard Zones for the Island of Hawai‘i.

**Lava Tube Hazards**

Lava tubes are common in areas that are covered by flood basalts typical of the Hawaiian volcanoes. The magma has a very low amount of silica that causes it to be highly viscous and very hot. As magma emerges and begins to flow, the surface of the flow cools rapidly and only the interior parts of the flow remain liquid. This creates voids within the cooled portion of the flow as the hot interior material continues to flow downslope. If the lava flow is particularly thick, larger voids are formed. Lava tube hazards are directly related to the diameter of the tube. The larger the interior space, the probability increases that the roof will collapse either on its own accord or when additional weight is placed on it.

**Seismic Hazards**

The Island of Hawai‘i experiences thousands of earthquakes a year, most are undetectable; however, some are strong enough to be felt or to cause damage. Most of the earthquakes in Hawai‘i are harmonic tremors associated with volcanic activity and magma moving beneath the surface. These tremors tend to be concentrated beneath the island’s two active volcanoes, Kilauea and Mauna Loa. Seismic tremors on the Big Island have caused ground cracks, landslides, ground settlement, tsunami and mudflows. Seismic activity can damage or destroy buildings and other structures, as well as utility and infrastructure lines, which often result in disruption of service.

Earthquakes over 6.0 on the Richter scale can result in significant damage to man-made structures. Since 1868 there have been 15 earthquakes greater than magnitude 6.0 with most of
them occurring on the south flank of Kilauea or Mauna Loa. The dates, locations, and magnitudes of these earthquakes are summarized in Table 3-1.

3.4.1 Potential Impacts

**PROPOSED ACTION**

**Flood Hazards**

Under the Proposed Action, major school facilities would be developed on the project site's lower parcel. The architectural concept of the campus envisions most of the buildings and structures to be elevated above ground level, thus reducing the risk to damage from flooding if the concrete channel along Edita Street should overtop. In conformance with applicable regulations, any additional storm water runoff generated by the Proposed Action would be contained within the property's boundary and site improvements would not alter the existing drainage patterns of surrounding properties. Thus, the Proposed Action would not increase the risk of flooding to neighboring or downslope parcels. Site-specific measures would be developed to control drainage and runoff resulting from impermeable surfaces and placement of new structures at the project site. During design development, detailed engineering studies would be conducted in order to develop appropriate drainage plans, which would take into account any measures that might be needed to address the potential flood hazard posed by the conditions along Edita Street.

**Volcanic Hazards**

Any development within this area of South Hilo is subject to the hazard of damage from lava flows and other volcanic hazards. There are no practical measures to avoid this impact.
Identification of areas that will be inundated by molten lava cannot be determined until the next eruptive phase begins.

**Lava Tube Hazards**

While there are no known lava tubes beneath the area to be developed, the Proposed Action does have the potential to contribute to the collapse of lava tubes if unknown tubes or voids are encountered during construction. Earth movement from construction activities, as well as general human occupation of the site could contribute to this occurrence. The most obvious hazard is when the roof of a previously unknown lava tube collapses. There have been known instances of construction equipment inadvertently collapsing previously unknown lava tubes. One such example is cited by Mcdonald, Abbott & Peterson (1983, p. 27) when “a bulldozer clearing land on the slope of Kilauea volcano broke through the roof of a lava tube and dropped about 10 meters [32.8 feet].”

**Seismic Hazards**

The threat from seismic hazards will always exist as humans have little control over the frequency and intensity of these unpredictable events. Any development on the Island of Hawai‘i is at risk of experiencing seismic activity based on the island’s geologic characteristics. However, since there would be minimal onsite grading, and buildings would not require permanent foundations, the risk of seismic-related subsidence or erosion is significantly reduced.

**ALTERNATIVES**

**Flood Hazards**

For Alternatives 1 and 3, the potential impacts related to flood hazards would be the same as the Proposed Action. These alternatives also proposed development of major facilities within the project site’s lower parcel, which may be subject to periodic flood events during severe storms. Alternative 2 would not be exposed to flood hazards as this alternative proposes to develop major school facilities within the upper parcel. Under this alternative, the only facility located on the lower parcel would be the agricultural facilities (i.e., barn and greenhouses).

**Volcanic Hazards**

For all three alternatives, the risk related to volcanic hazards would be identical to the Proposed Action.

**Lava Tube Hazards**

For all three alternatives, the risks related to lava tube hazards are greater as compared to the Proposed Action. All alternatives propose constructing major school facilities directly above Ka‘ūmanu Cave, which could increase the probability of collapsing the cave roof.

**Seismic Hazards**

For all three alternatives, the risk related to volcanic hazards would be identical to the Proposed Action. There would be no risk related to natural hazards under the No Action alternative.
3.4.2 Mitigation Measures

Flood Hazards
Onsite flood control would be accomplished by designing drainage systems to contain runoff within natural or man-made watercourses and detention basins or drywells. Prior to initiation of construction, the county would review proposed grading and construction (including drainage) plans for consistency with county requirements and good engineering practices. After approval, all plans would be monitored during periodic building inspections.

Volcanic Hazards
To date there are no adequate mitigation measures for lava flows. Numerous attempts have been made to control volcanic flows, including bombing, hydraulic chilling, and constructing walls to deflect flows. These methods have had mixed success. These methods cannot be expected to modify large or fast moving flows, and their effectiveness with smaller flows requires further evaluation (Keller, 1999).

Monitoring efforts to identify areas that may be threatened by lava in the first few hours of the next eruption phase are critical. Actual areas that would be covered by lava flows, and the warning time that can be given before lava reaches any given area are dependent upon key factors, such as the location of active vents, rate of lava production, duration of the eruption, and local topography. As a precautionary measure, the school should devise and maintain an evacuation plan for the campus.

Lava Tube Hazards
To minimize the potential hazard due to the collapse of an unknown lava tube that may be located within the project site, a geotechnical investigation should be performed for construction areas and appropriate measures employed to address site specific conditions. Such measures could include backfilling the lava tube; spanning the tube with girders or other means of support to minimize stress on the cave roof; or modifying the facility layout to avoid the lava tube altogether.

Seismic Hazards
Engineers, seismologists, architects and planners have carefully evaluated seismic hazards related to building construction. They have devised a system of classifying seismic hazards based on the expected strength of ground shaking and the probability of shaking actually occurring with in a specified time. The results are incorporated into the seismic provisions of the Uniform Building Code (UBC). The Island of Hawai‘i is located in seismic zone 4. All facilities would be designed and constructed in conformance with all required UBC specifications applicable to structures being constructed within seismic zone 4.

3.5 Biological Resources
A biological survey of the project site’s surface area was conducted in support of this EA. The survey consisted of four components, a botanical survey, an invertebrate survey, an avian survey, and a mammalian survey. The results of these surveys are discussed below. Additional detailed information can be found in the biological survey, which is attached as Appendix D. In
summary, the biological survey concluded that there is nothing unique about the project site. There is an abundance of similar habitats in, and around Hilo. Further there is no federally delineated Critical Habitat within or near the project site.

**Flora**

The botanical survey of the project site was undertaken on December 10 and 11, 2008. During the survey a total of 65 plant species were identified, 11 of which are classified as native, or occurring naturally, to the Hawaiian Islands. No protected plant species were recorded during the survey. A complete listing of plant species found within project site can be found in the biological survey report attached as Appendix D.

As previously noted, the project site is located on the Mauna Loa lava flow of 1880-1881. Thus, vegetation within the project site reflects the largely native plant community that developed after 1881 lava flow. As the surrounding properties came to be developed and Saddle Road was constructed, opportunities opened for non-native species to invade the native plant community. This process has been slow, but has accelerated where the native plant community has been disturbed, either by clearing, grubbing, or, in the case of Edita Street, cutting the property into two parcels with complete removal of a swath of native plants.

Despite the lack of soil, the relatively high rainfall in the project area has resulted in dense vegetation blanketing the project site. The upper parcel (west of Edita Street) is characterized as a native Lowland Wet Forest consisting primarily of 'ōhi'a trees (*Metrosideros polymorpha*) with a dense understory of Pacific false staghorn fern or 'uluhe (*Dicranopteris linearis*) (AECOS, 2009). The dense 'uluhe fern effectively keeps most other species from colonizing this parcel. There is considerable variation in the density of the 'ōhi'a trees from place to place, but can approach a closed canopy where undisturbed. In contrast, vegetation in the lower parcel (east of Edita Street) consists of a mix of native and non-native plant species, including albizia (*Falcateria moluccana*) trees and forests of strawberry quava (*Psidium cattleianum*).

**Fauna**

Invertebrate, mammalian, and avian field surveys of the project site were conducted between November 2008 and January 2009. During the surveys, a total of 20 invertebrate, 15 avian, and 1 mammalian species were documented to be present within the project site. A complete listing of faunal species encountered can be found in the biological survey report attached as Appendix D.

Invertebrate faunal and plant populations are interdependent and the presence of host plants is an indicator of the health of invertebrate populations. The 1880-1881 lava flow and the relatively young native forest it supports, has resulted in a limited diversity of Hawaiian host plants. Consequently, there is a limited number and diversity of native invertebrates at the project site. Additionally, the low elevation of the project site provides easier access to and has resulted in higher numbers of introduced predators, such as ants, which contribute to the low number of native invertebrate populations on site (AECOS, 2009). Several native species of arthropods were observed during the survey; however, no federally-listed species were noted. Further, there is no federally-designated Critical Habitat for any invertebrate species within or adjacent to the project site.
Avian diversity and densities were consistent with the habitat present within the project area. Of the 15 different avian species recorded during this survey, all but two are alien to the Hawaiian Islands. One indigenous migratory species, the Pacific Golden-Plover (*Pluvialis fulva*) was encountered during the survey. Additionally, a single Hawaiian Hawk (*Buteo solitarius*) or io was detected as an incidental observation while transiting between two count stations. The Hawaiian Hawk is an endemic endangered species currently protected under both federal and state of Hawai‘i endangered species statutes. The Hawaiian Hawk was first listed as endangered in 1967, proposed for down listing from endangered to threatened in 1993, and has recently been proposed for delisting altogether (ABCONS, 2009).

Although none were observed during the survey, it is possible that the project site is over flown between May and December by the endangered endemic Hawaiian Petrel (*Pterodroma sandwichensis*) or ua‘u and the threatened Newell’s Shearwater (*Puffinus auricularis newelli*) or ‘a‘o. However, there is no suitable nesting habitat within or close to the project site for either of these two seabird species.

With the exception of the endangered Hawaiian hoary bat (*Lasiurus cinereus semotus*), or ope‘ape‘a, all terrestrial mammals currently found on the Island of Hawai‘i are alien species. Only one mammalian species was detected during the course of this survey, the domestic dog (*Canis f. familiaris*). During the survey tracks, scat and sign of dog were encountered and several dogs were heard barking from the adjacent residential lots.

Although, Hawaiian hoary bats were not recorded during this biological survey, bats have been recorded on numerous recent surveys conducted within the general Hilo area. Key findings include the opinion that, at least on the Island of Hawai‘i, the bat is ubiquitous in areas that still have forest or dense cover, and it can be expected that Hawaiian hoary bats use resources within the general project vicinity on a seasonal basis.

### 3.5.1 Potential Impacts

**Proposed Action**

**Flora**

The lower parcel of the project site, on which the major campus facilities are planned for development, consists largely of non-native trees and weed species. The native Lowland Wet Forest comprising the upper parcel is not unique and is abundant in and around the Hilo area. Impacts to the upper parcels native ‘ōhi’a forest would be minimal, as the Proposed Action would only construct an elevated walkway and would leave much of the existing native forest untouched. Connections proposes to implement native reforestation projects throughout the entire campus, particularly within portions of the upper parcel. Finally, there are no protected, rare, or endangered plant species present on the project site and no significant adverse impacts to plant resources are anticipated.

**Fauna**

There is a small potential that construction-related activities, or habitat modification associated with the Proposed Action, may result in impacts to the following four species, all of which are protected under both federal and State of Hawai‘i endangered species statutes: Hawaiian Hoary Bat, Hawaiian Hawk, Hawaiian Petrel, and Newell’s Shearwater.
No Hawaiian Hoary Bats were detected during this survey, but they have been recorded within the general project area on numerous occasions. The principal impacts to the Hoary Bat posed from clearing and grubbing the vegetated portions of the project site is disturbance to roosting females during the pupping season. Females tending their young are less able to rapidly vacate a roost tree or bush as it is being felled, or cleared.

Construction noise is the principal potential impact the Proposed Action poses to Hawaiian Hawks. During clearing and grubbing operations, there is a small chance that construction noise could disturb birds nesting in the general project area. If disturbed while sitting on eggs or caring for young, adult birds may abandon the nest putting their eggs, and young, at risk of harm or mortality.

The principal potential impact that that the Proposed Action poses to Hawaiian Petrels and Newell’s Shearwaters is the increased threat that birds would be downed after becoming disoriented by exterior lighting. Exterior lighting may be necessary during construction activities, or while servicing construction equipment at night. Exterior lighting may also be problematic following build-out, with potential impacts posed by street lights and building lights.

In summary, Proposed Action would not result in any impacts to federally-designated critical habitat. Additionally, it is expected that construction activities and operation of the campus would not result in long-term significant adverse impacts to faunal resources present within the general project area.

**Alternatives**

Alternatives 1, 2 and 3 would result in more impacts to flora resources as compared to the Proposed Action, because all these alternatives require more clearing of the upper parcel’s native ‘ōhi‘a forest. Alternatives 2 and 3 in particular, would require the clearing larger areas of the ‘ōhi‘a forest. Potential impacts to faunal resources would be similar to those of the Proposed Action. The No Action alternative would have no effect on biological resources. All three alternatives could result in adverse impacts to the flora and faunal resources to the segment of Ka‘ūkīma Cave that underlies the upper parcel of the project site. Refer to Section 3.2 above for a discussion the Ka‘ūkīma Cave and its resources.

**3.5.2 Mitigation Measures**

Early consultation with the U.S. Department of Fish and Wildlife Service (USFWS) resulted in their conclusion that there is no federally-designated critical habitat on or near the proposed project site. However, the USFWS, and the findings of the biological survey, recommend the following measures to minimize any potential impacts to the Hawaiian Hoary Bat, the Hawaiian Hawk, the Hawaiian Petrel, and Newell’s Shearwater.

- To reduce the potential for interactions between clearing, grubbing and construction activity and Hawaiian hoary bats, it is recommended that clearing and grubbing not be undertaken during the birthing and pup rearing season. If clearing cannot be avoided during this period, it is recommended that a survey be conducted to verify if bats are present.
• To avoid disturbance to nesting Hawaiian Hawks, tree clearing should be avoided during the breeding season from March to September. If tree clearing must be conducted during this period, it is recommended that a survey be conducted to verify if any Hawaiian Hawks are present. One such survey could be an audio playback nesting activity survey, which should be conducted by a qualified ornithologist on the site where large trees will be removed prior to the onset of clearing and grubbing activities. This is to ensure that the construction activities will not disturb nesting Hawaiian Hawks. If nesting activity is detected, consultation with the USFWS would be required prior to conducting further clearing activity within 500 meters of the nest tree. This recommendation may be irrelevant if the current petition to delist the Hawaiian Hawk is enacted.

• To reduce the potential for interactions between nocturnally flying Hawaiian Petrels and Newell’s Shearwaters with external lights and man-made structures, it is recommended that any external lighting be shielded. This mitigation would serve the dual purpose of minimizing the threat of disorientation and downing of Hawaiian Petrels and Newell’s Shearwaters, while at the same time complying with the Hawai‘i County Code §14 – 50 et seq. This section of the county code requires the shielding of exterior lights to lower the ambient glare caused by unshielded lights, which negatively impacts the astronomical observatories located on Mauna Kea.

3.6 Air Quality
Generally the air quality in Hilo is very good due to the prevailing trade winds, which provide for good air circulation and clean fresh air. During times when there are southerly or "kona" winds or stagnant atmospheric conditions, the air quality can change. These conditions can result in the build up of both manmade and volcanic emissions. When the volcanoes are active, these conditions produce a volcanic haze called vog. Sunlight triggers a reaction in the gases and transforms the sulfur gases and water molecules to sulfuric acid, which makes up the volcanic haze. Manmade emissions that consist of carbon-based gases are also converted by sunlight to toxic carbon monoxide.

3.6.1 Potential Impacts
PROPOSED ACTION
The Proposed Action would not result in significant direct or indirect, long-term impacts to air quality. The school would not be a major stationary source of air pollutant emissions. The campus is being designed to have a small carbon footprint and make use of alternative energy sources and structural techniques that will keep cooling and lighting to a minimum. The project would not increase the discharge of carbon-based gases or change the amounts of volcanic gases released into the atmosphere.

Short-term impacts to localized air quality would likely be generated by construction activities at the project site. Construction-related vehicular activity would temporarily increase automotive pollutant concentrations at the project site and adjacent streets. Construction activities would also generate dust emissions resulting in an increase of particulate matter levels in the project area; however, adherence to construction site BMPs would significantly reduce these emissions. These
sources of pollutants are temporary in nature and would not result in long term adverse impacts on ambient air quality.

**ALTERNATIVES**
Similar to the Proposed Action, Alternatives 1, 2 and 3 would not adversely affect air quality. The No Action alternative would have no affect on ambient air quality.

### 3.6.2 Mitigation Measures
During the construction period, dust control measures would be implemented to reduce the amount of particulate matter emissions at the site. The erection of dust screens around the construction site and the frequent watering of unpaved roadways and exposed soil areas can help with on-site dust control. Dust can be further minimized by paving and/or landscaping bare earth areas as soon as practicable. Construction activities would be conducted in accordance with BMPs for construction sites and in compliance with all applicable air quality regulations, including provisions contained in HAR 11-60.1 – 33 *Fugitive Dust*.

### 3.7 Acoustical Environment
Noise in the area is low and derived mainly from motor vehicles, with occasional noise from road use and residential maintenance activities. Other noises are from the wind, birds, coqui frogs, domesticated animals and other sounds typical of a semi-rural neighborhood.

#### 3.7.1 Potential Impacts
**PROPOSED ACTION**
Short-term noise impacts generated from construction-related activities at the project site would result from the Proposed Action. Noise generated by such activities (e.g. earth moving equipment, construction vehicles, etc.) can generate intermittently high noise levels, particularly during close-in construction work. However, these impacts would be short-term and temporary in nature and would not result in long-term adverse impacts to the existing acoustical environment. Further, adhering to construction site BMPs and compliance with applicable noise regulations would minimize any construction-related noise impacts.

The Proposed Action would surround the campus with vegetation, such as trees, to create a barrier between the school and nearby residential areas. This vegetative barrier would provide a buffer for operational noise generated by school activities. In addition, many of the nearby residences are located closer to Edita Street and Kaumana Drive and are situated away from the campus proper, which is toward the middle of the lower parcel. Daytime school activities, as well as intermittent after school and evening events, would be monitored to ensure that activities do not significantly impact ambient noise levels. As such, school operations are not expected to adversely impact ambient noise levels.

**ALTERNATIVES**
Similar to the Proposed Action, alternatives 1, 2 and 3 would result in short-term construction-related impacts on the existing acoustical environment. However, unlike the Proposed Action, the other alternatives considered could result in somewhat increased noise effects on the adjacent residences. Alternatives 1, 2, and 3 all propose constructing major school facilities on the upper
parcel, where the majority of nearby residences are located. Residences abut both the northern and southern boundaries of the upper parcel. The No Action alternative would have no effect on the surrounding noise environment.

3.7.2 Mitigation Measures
Construction activities that generate noise would be conducted during reasonable hours. In cases where construction noise is expected to exceed the DOH’s maximum permissible property line noise levels, contractors would obtain a permit per HAR Title 11, Chapter 46 (Community Noise Control) prior to construction. DOH would then review the proposed activity, location, equipment, project purpose, and timetable in order to decide upon conditions and mitigation measures, such as restrictions of equipment type, maintenance requirements, restricted hours, and portable noise barriers. As the site is partially isolated, it is likely that there would be no need for special mitigation measures.

3.8 Land Use
Much of the land surrounding the project site historically was used for intensive agricultural cultivation. Over time, some of these lands have been converted to residential use, although some agricultural uses remain. However, because of its location within the 1880-1881 lava flow, the soils within the project site generally have been too thin to support pasturing of animals or intensive agricultural cultivation. Presently, the project site is overgrown, vacant, and undeveloped.

Although, many of the parcels are still vacant, the project site is bounded along much of its perimeter by existing residences on Kaumana Drive, Edita Street, and Melemanu Street. West of the property, on the far side of Kaumana Drive, is the main entrance to the Kaumana Cave, which has been designated as Kaumana Caves County Park. Downtown Hilo is located approximately 2 miles northeast of the project site.

The project site is within the State Land Use Agriculture District. Land immediately to the north and south of the project site are designated as Urban and Agriculture, respectively. State land use designations of the project site and surrounding vicinity are shown in Figure 3-5.

The project site is zoned A-1a (Agricultural – minimum 1 acre lot size) by the County of Hawai‘i. Lands immediately south of the project site are also zoned for General Agricultural use, and lands to the north are zoned predominantly for Single Family Residential use. County zoning designations of the project site and surrounding vicinity are shown in Figure 3-6.

The County of Hawai‘i General Plan designation for the subject parcel is Low Density Urban, which permits residential, ancillary community and public uses, and neighborhood and convenience-type uses.

The Proposed Action is allowable within the definitions of the various land use designations discussed above; however, permits requiring approval by the County and the State Land Use Commission would have to be secured.
3.8.1 Potential Impacts

**PROPOSED ACTION**
From a regional planning perspective, the proposed construction and operation of the school would not result in adverse impacts as it would occur within an area with compatible land uses, as well as proximal to infrastructure and services capable of serving the development. Conversely, the Proposed Action would beneficially impact area land use by providing permanent public educational facilities to support the growing residential community of Kaūmana.

No significant adverse impacts are anticipated as a result of the proposed project. On-site construction-related impacts (e.g. excavation, hauling, drilling, heavy equipment usage, etc.), would be minor, and would only temporarily affect the integrity of surrounding land uses in the area.

**ALTERNATIVES**
Alternatives 1, 2 and 3 would result in similar land use impacts as the Proposed Action. The No Action alternative would have no effect on existing land use.

3.8.2 Mitigation Measures
No mitigation measures are warranted or proposed.

3.9 Utilities

**Energy and Communications**
Electrical services in the project vicinity are provided by the Hawaii Electric Light Company (HELCO) and communications by fiber optic backbone connections provided by Hawaiian Telcom.

**Water Supply**
The Hawai‘i County Department of Water Supply (DWS) provides water to the area via an existing 8-inch waterline along Kaūmana Drive and from an existing 8-inch waterline along Edita Street both fronting the project site. The current water availability, which is subject to change, is limited to a maximum of seven units of water per pre-existing lot of record. Each unit of water is equal to a maximum usage of 600 gpd; therefore, a maximum of 4,200 gpd is available for the proposed project.

**Wastewater**
Currently, there is no municipal wastewater system serving the project area, and the Proposed Action, like the surrounding area residences, would have to provide its own wastewater system.

**Drainage**
In the Kaūmana area, the storm drainage system consists of roadside ditches, culverts and narrow channels. Most of the area’s storm water runoff is discharged through Waipahoehoe or Alenaio Stream. The project site is underlain by porous pāhoehoe lava flow. This results in a terrain in which the majority of rainfall rapidly percolates into the substrate.
During storm events, runoff along the upper regions along Kaʻūmanoa Drive flow into and through Kaʻūmanoa Cave. Stormwater exits through an opening at Edita Street into a concrete channel that runs parallel and adjacent to the street. From the concrete channel, storm water flows under the roadway and discharges into an intermittent stream that borders the lower potion of the property. Under most circumstances the existing drainage system is adequate. While not common, stormwater has been known to overtop the concrete channel and flow across Edita Street.

Solid Waste
Solid waste management on the Island of Hawai‘i has undergone significant changes in the past few decades. Currently, residences take their solid waste to any one of 21 transfer stations around the island. The solid waste is then hauled to either the Hilo or Pu‘uanahulu landfills. In some areas, private haulers are paid to pick-up refuse from residences for disposal at a landfill.

3.9.1 Potential Impacts
PROPOSED ACTION
Energy and Communications
The Proposed Action would obtain energy and communication services from the utility providers discussed above. Appropriate coordination with both HELCO and Hawaiian Telcom would be conducted during the design and construction phase of the proposed improvements.

The Proposed Action is not anticipated to have any adverse impacts on either energy or communications utilities and is expected to have little to negligible impacts on the existing electrical distribution and communications networks of the area. There would be no disruption or significant increased demand for either utility. Existing systems are able to accommodate the demands of the proposed project. Additionally, energy demands from HELCO would be substantially reduced as a result of the Proposed Action’s energy saving features previously discussed in Section 2.1.2.

Water Supply
The Proposed Action would connect to the existing county water supply infrastructure for its potable water needs. However, as previously discussed, the Proposed Action would serve its non-potable water supply needs with an extensive rainwater collection system consisting of catchment tanks, storage reservoirs/tanks, and a network of water lines to distribute the collected rainwater throughout the campus. Rainwater would be collected from building roof tops and transmitted to a catchment tank(s) in the eastern portion of the campus. Rainwater would then pass through a catchment water treatment system and be pumped up to a reservoir tank(s) in the western portion of the campus. From these reservoir tanks, water would be pumped throughout the campus for non-potable water uses.

The county’s DWS has state that it has no objection to the use of a private catchment system. However, DWS’s Water System Standards do not cover catchment systems and their plan review would be limited to the service lateral, water meter, and backflow prevention assembly installation only. Further, DWS states that the potable water system and the catchment system cannot be interconnected.
Using a gross estimate of 60 gpd/student, the project could result in a potable water demand of roughly 26,100 gpd. This demand would be reduced by the use of water efficient fixtures and by the use of rainwater and recycled water for non-potable uses such as toilet flushing, landscaping and agricultural uses. Based on the approximate square footage of building roof area and average rainfall in the project area, it is estimated that as much as 30,000 gpd could be collected by a catchment system. Potable water use would be limited primarily to faucets and kitchen use.

During the project’s design phase, detailed analysis would be conducted to generate a more accurate estimate of potable water demand. Analysis would take into account, among other things, the number and type of fixtures to be used in the facility (e.g., waterless urinals, high efficiency toilets, dual-flush toilets, etc.), to what extent rainwater and recycled water can be utilized in place of potable water, and if needed, where development plans could be scaled back to contain potable water demands within the DWS allocation. For example, Connections could choose to retain the kitchen function at the Kress building in downtown Hilo, which would further reduce the potable water usage at the project site. During design development, DLNR’s Engineering Division and the County of Hawai’i DWS would be provided with maximum daily water usage calculations prepared by a professional engineer licensed in the State of Hawai’i. Calculations would quantify the estimated water demand for the proposed project, so that it can be included in the state’s and county’s respective water plans.

It is Connections intention to develop an environmentally sustainable campus, which includes minimizing its use of fresh potable water. Every effort would be made to meet the school’s water needs with alternative water sources (i.e., rainwater and recycled water). Options that use alternative water sources would be given priority consideration above potable well development. Use of rainwater and recycled water would be utilized to the maximum extent possible, not only to reduce their demand on the municipal water supply, but to demonstrate their commitment to sustainability. However, if during design development, it becomes evident that developing a potable may be needed, additional detailed analyses would be conducted to determine any potential adverse effects associated with this alternative, including impacts on other wells and the underlying aquifer. If warranted, a Supplemental EA could be prepared specifically to address this issue if its implementation emerges as a viable option.

If a potable well is developed for this project, it would be considered a regulated public water system and would have to comply with HAR 11-20 "Rules Relating to Potable Water Systems.” Among other things, HAR 11-20 requires demonstration that the water system can meet the minimum capacity requirements to comply with safe drinking water standards and requirements; completion of an engineering report and approval of the new public water system source; and a source water assessment and preparation of a source water protection plan. In addition, the public water system must be operated by a certified distribution system and water treatment plant operator in accordance with HAR 11-25 “Rules Pertaining to Certification of Public Water System Operators.” As an option related to this alternative, Connections could enter into a water development agreement with the county’s DWS. Under a water development agreement, the school would be responsible for engineering and developing the well, which would then be turned over to DWS to maintain and operate. DWS would then allocate a portion of the water back to the school.
The project site is not located within a designated water management area; therefore, a Groundwater Use Permit would not be required if a potable well were to be developed. However, a Well Construction Permit and a Pump Installation Permit would be needed from the Commission on Water Resource Management before well construction can begin and before groundwater is developed as a water supply source.

The project’s water system would be designed in compliance with all applicable state and county requirements. With adherence to applicable regulations and guidelines the Proposed Action is not expected to adversely impact the existing water supply system servicing the project area and surrounding vicinity.

Wastewater
As discussed in Section 2.1.2 above, Connections intends to implement a biological wastewater system that mimics the cleansing function of wetlands and does not produce toxic bi-products, such as sludge. These types of systems would utilize a combination of septic tanks and a series of biological treatment tanks. The resultant treated water would be of R-2 quality, which could be recycled or could be released safely back into the environment. R-2 water could be used for subsurface irrigation of school yards, athletic fields, and some above ground food crops. Drip irrigation and surface use (with a buffer if spraying) is also allowed under certain conditions for certain non-food plants (e.g., ornamentals, trees, orchards, etc.).

Use of recycled water would reduce the potable water needed to support the project. Its use would comply with DOH’s Guidelines for the Treatment and Use of Recycled Water, including the preparation and approval, as needed, of an irrigation plan, a management plan, a public education plan, an employee training plan, a vector control plan, and a monitoring plan. The water reuse project would also require DOH’s approval prior to construction.

If it is not economically feasible to implement a biological wastewater and recycled water system, the school can resort to installing a traditional septic system with leach fields or other disposal system as deemed appropriate. In accordance with the DOH guidelines, the project could utilize a maximum 1,000-gallon septic tank for each individual wastewater system (IWS), which would serve the equivalent of a 5-bedroom residential house. For buildings on larger sites, with larger flows, multiple IWS could be used as DOH allows one IWS per 10,000 square feet of land area.

The Proposed Action is not expected to result in wastewater-related adverse impacts. The wastewater systems would be designed in compliance with all applicable DOH Rules (HAR, 11-62, “Wastewater Systems” and HAR 11-55 “Water Pollution Control”, as applicable) by licensed professionals in the State of Hawai’i, and would be installed by licensed contractors. Hawaii’s Cave Protection Law does permit septic systems in the vicinity of lava tube caves, provided that they use solid tanks and do not permit sewage flow into the cave. Once operational, the septic system would require maintenance and monitoring to ensure that no accidental releases of raw sewage occurs.

The project site is located within a critical wastewater disposal area (CWDA) with one (1) acre lot exception as determined by the Hawai‘i County Wastewater Advisory Committee. CWDAs
are areas where wastewater disposal has the potential to cause adverse effects to the environment and human health because of hydrogeological conditions. Wastewater systems located in CWDAs may be subject to more stringent requirements that meet higher effluent standards, as determined by DOH's director. Adherence to applicable standards and regulations, and proper maintenance and operation of the system should ensure no significant direct or indirect adverse impacts to the environment or to human health.

**Drainage**

As a result of the Proposed Action, some existing vegetated areas would be covered with impermeable surfaces, thereby reducing percolation and increasing the volume of surface runoff. However, site improvements would include a drainage system, which may include drywells or detention/retention areas of sufficient capacity to accommodate runoff from impermeable surfaces. Therefore, implementation of the Proposed Action would not significantly increase the flow of stormwater or adversely impact existing storm drainage facilities serving the area.

Under the Proposed Action, existing natural drainage patterns generally would be kept the same. In undisturbed areas, stormwater would be allowed to continue its existing flow patterns. Vegetation would retard surface flow and some of the water will percolate into the porous substrate as it flows across the site. In addition, drainage improvements would be constructed to accommodate surface runoff from paved areas, and if warranted, potential flood water exiting Kaumana Cave. Drainage improvements would include a network of swales, inlets and drainage lines to direct runoff through the campus, and a series of detention basins. The detention basins would be designed to accommodate on-site runoff by containing the bulk of the flow and allowing it to percolate into the ground and/or to evaporate. Because the underlying ground surface is so porous, the basins would be dry most of the time. The sizes and number of detention basins will be designed when the final engineering plans for the site are developed.

**Solid Waste**

Currently, Connections has a contract with a private refuse collection service that picks up the solid waste and takes it to the dump. Connections intends to extend their existing contract, and have the same private service collect and dispose of solid waste generated at its new campus.

The Proposed Action would not be a major generator of, and would not result in, significant increases in the accumulation or disposal of solid waste. In addition, Connections intends to promote ecologically sound principals and run a "green" school. The school will implement a comprehensive recycling program that would be a part of daily campus operations. Onsite separation bins for plastic, glass, metal, cardboard, aluminum and paper will be located in food preparation and serving areas, as well as in other appropriate locations throughout the campus.

**ALTERNATIVES**

Under Alternatives 1, 2 and 3 impacts to existing utility systems would be similar to the proposed action. The No Action alternative would have no effect on existing utilities and infrastructure.
3.9.2 Mitigation Measures
The Proposed Action would not result in significant adverse impacts to existing utilities and infrastructure, and no mitigation measures are required. Furthermore, Connections will be designing their new campus to be a “green” school. Inherent in its design will be numerous environmentally sustainable technologies and strategies that would serve to further minimize any negligible impacts the Proposed Action would have on existing utility and infrastructure systems.

If it is determined that a potable water well needs to be developed, detailed analyses will be conducted to identify any potential adverse impacts to the underlying aquifer and other wells in the vicinity of the project site. If warranted, a Supplemental EA can be prepared to address this specific issue.

3.10 Historic and Cultural Resources
The discussion below regarding the historical perspective and results of the field investigations have been excerpted from two studies, both prepared by Pacific Legacy, Inc. The first study is the Archaeological Assessment Survey of the Connections Charter School Kaʻūmohana Property prepared in 2008. The second study, the Archaeological Field Inspection of Kaʻūmohana Cave was completed in 2010. For additional detailed information, please refer to the full text of these studies which are attached as Appendices E and F, respectively.

**Historical Perspective**
Research has indicated that there is little evidence of any human activity in the project area during the Pre-Contact period (Pacific Legacy, 2008). At the time of the Māhele ʻĀina in the 1840s (also known as the Great Māhele), two parcels adjacent to the project area were awarded to native claimants. The first parcel was part of an inherited claim to three land areas: Kukuau 2 in Hilo, Waikoloa in South Kohala, and Kiʻilae in South Kona. Because the claim covers such a large area, the document does not have any direct information about the Kukuau parcel (Ibid.) The second parcel, located immediately north of the project area, was claimed by an individual named Kukuleau. This indicates that there was at least some human activity in the area during that period (Ibid.).

Between 1880-1881, a lava flow that originated on the slopes of Mauna Loa passed through the ahupua'a of Ponahawai, burying everything in its path. As this flow approached and threatened Hilo, the people of the town called upon Princess Ruth Keʻelikōlani Keanolani Kanōhoahoa for help (Pacific Legacy, 2008). The residents of the threatened community requested that she intercede on their behalf with the volcano goddess Pele, whose fiery flow was threatening their homes. Hawaiian language newspapers of the time reported that Princess Ruth journeyed to the lower edge of the flow where she chanted and made offerings to the goddess. That evening she lay down to sleep in the path of the lava. The next morning the flow had stopped in front of the sleeping princess. Though it spared Hilo, the 1880-1881 flow did inundate the Kaʻūmohana area, including the entire project site (Ibid).

**Field Investigations of Surface Area**
The entire project area is situated on the 1880-1881 lava flow, and is presently overgrown, vacant, and undeveloped. As a result of the lava flow, it is surmised that any archaeological or
historic sites within the project area would have been destroyed. Consequently, the project site contains very little evidence of any human activity during the Pre-Contact period. During the field investigation, no archaeological sites were encountered and it appears that subsequent to the 1880-1881 flow, permanent human use of the area stopped (Ibid.). Today much of the area surrounding the project site has been subdivided for single family residences.

Field Inspection of Ka'imana Cave
At the request of DLNR's State Historic Preservation Division (SHPD), an archaeological investigation was conducted of the accessible portion of Ka'imana Cave that underlies the project site's upper parcel. One of the purposes of this inspection was to verify previous accounts of historic elements within the cave, which include pectoglyphs (names chipped into the cave's walls) and electrical insulators on the cave walls. Dr. Stone, in his September 4, 2009 comment letter on the original Draft EA for this project, also mentioned there are no burials in the cave and that ti wrapped offerings are left just inside the cave entrance, which is within the county park. The portion of the cave that underlies the project site's lower parcel was not inspected as it is believed to be inaccessible.

The field inspection found an abundance of pecked names near the cave entrance at the county park. Deeper into the cave, the pecked names become more sporadic with occasional dense concentrations. The deepest concentration of names encountered were roughly 850 feet from the cave entrance, which would place this location directly beneath Ka'imana Drive, outside the project site. Beyond that point only two sets of pecked names were noted, both of which appear to be recent. In addition to the pecked names, numerous names have been spray painted onto the cave walls. No names that appear to be older than 50 years were found in the cave segment that underlies the upper parcel. The field inspection also found no evidence of "electrical insulators attached to the cave wall," which were mentioned by Dr. Stone in his comment letter (2009).

Cultural Resources
In the late 1990s, one of the proposed alternative routes for the Puainako Street Extension and Widening project ran directly through the project site. Based upon work performed in support of that project's EIS, no evidence of traditional cultural properties or practices were identified to occur within that project area, which encompasses Connection's project site (Okahara and Associates, 2000). This conclusion was based on several archaeological surveys, archival research, oral interviews and the lack of claimants offering knowledge of such resources.

Findings of the archaeological investigation conducted for the Proposed Action seem to support the conclusions made in the Puainako Street Extension and Widening project EIS. No archaeological surface features were encountered during the investigation. The absence of sites suggests that human activity at the project site has been limited since 1880, with the exception of an occasional pig hunter (Pacific Legacy, 2008).
Further efforts were made to ascertain whether any cultural practices occurred within the project site. Requests for information were sent to the Hawaiian Civic Club of Hilo, the Edith Kanakaole Foundation and Mr. Kea Maly in an attempt to identify any cultural resources and practices that may be conducted within or around the project site. No responses were received. These request letters are attached as Appendix G. The school also held a public information meeting on April 16, 2009. This meeting was publicized by sending home informational flyers with the Connections’ students, posting of informational flyers around the Kress Building and downtown Hilo, and by placing an information bulletin in the Hawai‘i Tribune Herald. No persons at the public information meeting spoke in regards to any cultural resources or practices occurring within the project site. Findings of the archaeological investigation, as well as the lack of response for information and public input seem to suggest that the conclusion reached by the Puainako Street Extension and Widening project EIS that there are no traditional cultural practices occurring within the project site are still valid.

3.10.1 Potential Impacts

PROPOSED ACTION

Results of both the archaeological field inspection of the surface area and the field inspection of Ka‘ūmāna Cave indicate that no archaeological sites or historic elements were encountered within the project site. The only exception was a few pectoglaphs noted during inspection of Ka‘ūmāna Cave. Under the Proposed Action, a lightweight walkway is the only structure being planned for the upper parcel. This walkway would be located beyond the 100-foot protective buffer surrounding Ka‘ūmāna Cave. Therefore, it is expected that the Proposed Action would have no significant adverse impact on any historic properties on the surface and within the lava tube. The Proposed Action is also not expected to adversely impact cultural resources or practices.

The Revised Draft EA and Archaeological Assessment Survey, including the Archaeological Field Inspection of Ka‘ūmāna Cave, which is attached as an addendum to the original Assessment Survey, was submitted to SHPD for review on August 19, 2010. Documentation of the submittal is attached to this EA as Appendix H. As yet, no comments or determination of effect has been received from SHPD.

ALTERNATIVES

Alternatives 1, 2 and 3 could result in adverse impacts to Ka‘ūmāna Cave and thus could affect any historical element, if present, within the cave if project actions caused the cave to collapse. The No Action alternative would have no effect on historic or archaeological resources.

3.10.2 Mitigation Measures

It is unlikely that any historic or cultural artifacts would be unearthed during construction activities. However, it is recommended that an archaeological monitor be on call to inspect any inadvertent find that may be encountered during construction. The following measure shall also be taken per SHPD (letter dated February 17, 2009): “In the event that historic resources, including human skeletal remains, lava tubes, and lava blisters/bubbles are identified during construction activities, all work needs to cease in the immediate vicinity of the find, the find needs to be protected from additional disturbance, and the State Historic Preservation Division, Hawai‘i Island Section needs to be contacted immediately.”
3.11 Visual, Aesthetic and Recreational Resources

The natural beauty of the South Hilo district is dominated by Mauna Kea and Mauna Loa. Views of the mountains are possible from various locations throughout the area. The project area is located on the lower slopes of Mauna Loa, inland of the town of Hilo. There are some locations within the project site that may have views of Hilo Bay or Mauna Kea, depending on whether the vegetation is thinned or entirely removed. The site is not readily visible from Hilo Bay and it would be difficult to locate and spot from this area.

Kaūmana Cave and the county’s Kaūmana Cave Park are well-known recreational resources in the near vicinity to the project site. The park and the cave are publicized in visitor guides and is visited frequently by visitors and locals alike.

3.11.1 Potential Impacts

PROPOSED ACTION

The campus plan is composed of several small, single-story buildings clustered along an arcing pattern situated near the middle of the lower parcel. This layout would provide for a small vegetative belt surrounding the campus, which could consist of a combination of existing vegetation and reforested areas. The vegetative belt would help to blend the campus with the surrounding rural landscape and serve as a visual buffer between the school and the surrounding residential areas. As such, the location and operation of the new campus is not expected to result in significant adverse impacts on visual and aesthetic resources in the area.

Along the upper parcel, the proposed walkway would be hidden amidst the existing ʻōhiʻa forest, which would remain largely intact. Thus this too would result in no significant adverse impacts to visual and aesthetic resources.

The Proposed Action is not expected to result in adverse impacts to any recreational resource. The Kaūmana Caves Park is outside the project site and implementation of the Proposed Action would in no way restrict any use of the park, including the portion of the Kaūmana Cave that is within park boundaries. The portion of the Kaūmana Cave that underlies the project site is state property. Entry to this portion of the cave is not prohibited; however, visitors to this portion of the cave should be obtaining a right-of-entry from DLNR. Implementation of the Proposed Action is not expected to change these conditions, as development would be limited to the surface area and beyond a 100-foot buffer, as measured from the edges of the cave walls.

ALTERNATIVES

In contrast to the Proposed Action, Alternatives 2 and 3 would involve considerable clearing of the upper parcel’s ʻōhiʻa forest. This would not only increase the visibility of the campus from nearby residences, but would also reduce the amount of ʻōhiʻa forest, which could be considered a visual and aesthetic resource. While Alternative 1 also proposes to develop major school facilities on the upper parcel, this scheme would place the buildings in a linear fashion down the middle of the parcel. This would serve to retain a substantial amount of forested area between school facilities and nearby residence resulting in lesser impacts to visual and aesthetic resources. The No Action alternative would have no effect on visual and aesthetic resources.
3.11.2 Mitigation Measures
No mitigation is warranted or proposed.

3.12 Circulation and Traffic

Existing Conditions
Existing traffic volumes in the project area are low and there are no signalized intersections in the immediate vicinity of the project site. The two primary circulation routes within the immediate vicinity of the project site are Kaūmāna Drive located northwest of the site, and Edita Street, which bisects the site dividing it into its upper (western) and lower (eastern) halves. Kaūmāna Drive (Rte 200) is a two-way road, with an east-west orientation. It is the main roadway serving the Kaūmāna area, connecting it to Hilo town to the east, and Saddle Road to the west. The County of Hawai‘i public transportation bus service (Hele On) runs along Kaūmāna Drive. Edita Street is a two-lane, two-way road which intersects with Kaūmāna Drive, extending in a north-south orientation through the middle of the project site.

Level-of-Service Concept
Level of Service (LOS) is a qualitative measure to describe the flow or operational characteristics of traffic as perceived by the level of congestion or delays experienced by motorists. There are six grades of LOS measured from “A” to “F”. In general, LOS A is considered best, representing free-flow conditions with no congestion. LOS F is considered worst, representing severe congestion with stop-and-go conditions. For peak hour traffic conditions in urban areas the minimum acceptable LOS is D. LOS grades A through F are summarized in Table 3-2.

<table>
<thead>
<tr>
<th>Level-of-Service</th>
<th>Description</th>
<th>Time Delay (in seconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Little or no delay</td>
<td>&lt; 10</td>
</tr>
<tr>
<td>B</td>
<td>Short traffic delays</td>
<td>10.1 to 15.0</td>
</tr>
<tr>
<td>C</td>
<td>Average traffic delays</td>
<td>15.1 to 25.0</td>
</tr>
<tr>
<td>D</td>
<td>Long traffic delays</td>
<td>25.1 to 35.0</td>
</tr>
<tr>
<td>E</td>
<td>Very long traffic delays</td>
<td>35.1 to 50.0</td>
</tr>
<tr>
<td>F</td>
<td>Extreme traffic delays(2)</td>
<td>&gt; 50.1</td>
</tr>
</tbody>
</table>

Notes:
(2) When demand volume exceeds the capacity of the lane, extreme delays will be encountered with queuing which may cause severe congestion affecting other traffic movements in the intersection. LOS F conditions usually warrant improvement of the intersection.

Existing traffic volumes in the project area are low and the adjacent roadways currently operate at LOS A or B. This implies good operating conditions, minimal delays, and high levels-of-service. The existing levels-of-service for project area roadways is presented in Table 3-3.

3.12.1 Potential Impacts

A Traffic Impact Analysis Report (TIAR) was prepared in support of this EA. The TIAR assessed future impacts of the Proposed Action on the local traffic and circulation patterns. The TIAR study methodology consisted of conducting an analysis of existing traffic conditions, determining future background traffic projections, and identifying future project-related traffic impacts based on the Proposed Action phasing presented in Section 2.1.3. The impact analysis presented in this section is based on the findings of the TIAR which has been attached as Appendix I.

PROPOSED ACTION

Under the Proposed Action, primary access to and egress from the project area would be via the intersection of Kaumana Drive at Edita Street. Access to and egress from the campus from Edita Street would be provided by a new driveway into the lower parcel (referred to as Road "D" in the traffic report).

Traffic-related impacts of the proposed project involved the determination of project-generated traffic during the morning (AM), midday (end of school day), and afternoon (PM) weekday commuter peak period and the determination of the levels-of-service at affected roadway intersections subsequent to implementation of the project. The proposed project would generate 108 inbound and 79 outbound trips during the morning peak hour, 52 inbound and 72 outbound trips during the midday peak hour and 31 inbound and 30 outbound trips during the afternoon peak hour. The total number of peak hour vehicle trips generated by the completed project during a weekday would be 621, of which 187 would be generated during the AM peak hour, 124 during the Midday peak hour, and 61 during the PM peak period (Rowell, 2010). Projected trip generation rates for the proposed action, broken down by development phase, are presented in Table 3-4 below.

</tbody>
</table>

Based on the traffic generation data, a Level-of-Service analysis was performed. The LOS analysis concluded that the majority of vehicular approach and movement patterns on adjacent public roadway intersections and proposed internal campus driveways would experience little or no delays after full buildout of the Proposed Action in the year 2022. The LOS analysis projects that traffic movements in the project area would continue to operate at LOS A and B, with over 73 percent of all movements operating at LOS A and 27 percent of movements operating at LOS B (Rowell, 2010)

Based on the findings of the TIAR, construction and operation of the Proposed Action would not generate large increases in traffic volumes and would not result in adverse impacts to traffic and circulation patterns in the project area. A summary of the peak hour level-of-service for the Proposed Action and alternatives are presented in Table 3-5.

ALTERNATIVES
Similar to the Proposed Action, Alternatives 1, 2 and 3 would not generate large volumes of traffic, and traffic movements would operate at LOS A or B (Table 3-5). Therefore, Alternatives 1, 2 and 3 would not result in adverse impacts to traffic and circulation patterns in the project area. The No Action alternative would have no impact on the existing or future circulation and traffic patterns.

</table>

**NOTES:**
1. Peak hour conditions analyzed are "worst-case" conditions, which is the sum of the peak hour of the subject street plus the peak hour of the project.
2. Delay is in seconds per vehicle.
3. LOS denotes Level-of-Service calculated using the operations method described in Highway Capacity Manual. LOS is based on delay.
4. This intersection will be constructed as part of the project.
3.12.2 Mitigation Measures

Because all traffic movements are expected to operate at LOS A or B, no mitigation is required. However, in order to minimize any potential effects to traffic and circulation in the project area, it is recommended that Connections implement some traffic controls. These traffic controls include, but are not limited to the following:

- Since trip generation rates for the area may change over the next decade, additional traffic surveys should be performed upon completion and occupancy of Phase 3, Phase 4 and Phase 6 to confirm the trip generation analysis and that the study intersections are operating as predicted. If these surveys determine that additional mitigation measures are needed, the appropriate improvements should be identified and implemented.

- A Traffic Management Plan (TMP) should be developed to promote ridesharing strategies such as carpools by students and employees, and use of alternative modes of transportation such as buses and bicycles. There is an existing Hele On bus route along Kaumana Drive, however, as part of the TMP, coordination with the Hele On bus system should be initiated to ensure public bus service to and from the new campus.

- Alternative modes of transportation for internal trips within the project site should be encouraged, including the use of bicycles, golf carts, etc. Adequate parking facilities for these alternative modes of transportation should be provided.

3.13 Socio-Economic Considerations

The County of Hawai‘i and the city of Hilo have a rather diverse ethnic background with no clearly discernible racial majority or minority. Hilo and Hawai‘i County, in general, have a diverse population and is among the 100 fastest growing counties in the United States. The median family income is less than 65 percent of that of the Country as a whole, with over 15 percent of individuals with income levels below the federal poverty level (U.S. Bureau of the Census, 2001). The socio-economic characteristics for Hawai‘i Island and for Hilo are summarized below in Table 3-6.

<table>
<thead>

</tr>
</tbody>
</table>

The student population at the Connections school generally reflects the ethnic and racial diversity of the general population. As a public charter school Connections will continue to provide an educational opportunity for students from all economic levels.

3.13.1 Potential Impacts

PROPOSED ACTION
The Proposed Action is not expected to increase the county’s resident or visitor populations. Positive short-term economic impacts would be generated during the project construction phase including jobs, local purchases of goods and services, and procurement expenditures associated with supplying and maintaining the new facility. The Proposed Action is not expected to result in a major increase in permanent employment.

The proposed project would result in beneficial social impacts by improving educational services and opportunities for Hilo’s children by providing a culturally and environmentally-sensitive learning environment. Construction of a new campus would allow Connections to continue teaching at its high educational standard and their proposed agricultural program would provide local children with marketable skills for working in and developing small sustainable agricultural operations in the area.

ALTERNATIVES
Alternatives 1, 2 and 3 would result in similar beneficial socio-economic impacts as the Proposed Action. The No Action alternative would have no effect on the existing socio-economic conditions.

3.13.2 Mitigation Measures
No mitigation is warranted or proposed.

3.14 Cumulative Impacts
Cumulative impacts on environmental resources can result from the incremental effects of given development when evaluated in conjunction with other past, present and reasonably foreseeable public and/or private future actions. A given action may have minimal impacts when considered individually, but when considered in combination with other actions it could result in adverse environmental impacts. Most past, present, and future actions in the surrounding area involve the development of sites for single-family residences. However, the timing and even the certainty of many of these projects is unknown, therefore potential cumulative impacts are difficult to assess.

The Proposed Action involves the relocation of a school that is currently serving the Hilo/Puna community, and it is not anticipated to result in major secondary or cumulative impacts. From a regional perspective, impacts are limited to the planned growth of the school, including a potential pre-Kindergarten program. From a local perspective the Proposed Action would have noticeable, but negligible, cumulative effects on the existing residential areas, largely due to the operation of a new school campus on a presently undeveloped site, and the associated increase in vehicular traffic volume. However, as discussed in Section 3.12.1, cumulative traffic growth was
considered in the TIAR analysis and the findings indicated that the proposed project would not result in significant adverse traffic impacts.

The project will provide short-term construction jobs that will be filled by local residents but would not induce in-migration. The Proposed Action would likely have beneficial effects on socio-economic resources by improving educational services and opportunities for area residents and by enhancing access to educational opportunities and providing a culturally and environmentally sensitive learning environment.

4.0 CONSISTENCY WITH GOVERNMENT PLANS, POLICIES AND CONTROLS

4.1 State Land Use Law
All lands within the State of Hawai‘i are classified into one of four land use districts — Urban, Rural, Agriculture, or Conservation — by the State Land Use Commission pursuant to Chapter 205, HRS. The project site lies within the State Land Use Agriculture District and would require Land Use Commission approval of a Special Permit for a new non-conforming use.

4.2 State of Hawai‘i Environmental Policy
Chapter 344, HRS, the State Environmental Policy, encourages productive and enjoyable harmony between people and their environment. The policy promotes efforts which would prevent or eliminate damage to the environment and biosphere, stimulate the health and welfare of humanity, and enrich the people of Hawai‘i’s understanding of ecological systems and natural resources. The Environmental Policy seeks to conserve natural resources and enhance the quality of life for residents of Hawai‘i. Expanding citizen participation in the decision-making process is one of the guidelines specified in Chapter 344, HRS. During the consultation process for this EA, comments were solicited from federal, state, and county agencies; public utilities; private interests; and other potentially interested parties (presented in Appendices A, B and C).

4.3 Hawai‘i State Plan
Adopted in 1978 and revised in 1991 (HRS Chapter 226 as amended) the Hawai‘i State Plan establishes a set of themes, goals, objectives and policies that are meant to guide the State’s long-term growth and development activities. The three themes that express the basic purpose of the Hawai‘i State Plan are individual family self-sufficiency, social and economic mobility, and community or social well-being. The Proposed Action would promote these goals by enhancing elementary middle and high school educational facilities in the Hilo and Kaūmana area thus enhancing the quality-of-life, community and social well being of the region.

4.4 Hawai‘i County General Plan
The General Plan for the County of Hawai‘i is a policy document that expresses the broad goals and policies for the long-range development of the Island of Hawai‘i. The plan was adopted by ordinance in 1989 and revised in 2005 (Hawai‘i County Department of Planning). It is divided into thirteen elements with policies, objectives, standards, and principles applicable to each element. Goals, Policies, and Courses of Action identified in the General Plan that are pertinent to the proposed action include:

Education Goals
- Each Charter school is responsible for selecting their own sites.
- Utilize publically owned lands in the best public interest and to the maximum benefit.
Education Policies
- Encourage continuous joint pre-planning of schools with the Department of Education.
- Ensure coordination with roads, water and other support facilities and considerations such as traffic safety, and access for vehicle, bicycle and pedestrians.
- Encourage master planning of present and proposed public and private institutions.
- Encourage combining school yards with county parks and allow school facilities for afterschool use for recreational, cultural and other compatible uses.

Education Courses of Action
- Encourage the establishment of additional schools as the need arises.
- Encourage continual improvements to existing educational facilities.

4.5 County Zoning
The project site is zoned A-1a (General Agricultural) by the County of Hawaii. In accordance with the County Zoning Code, schools are an allowable use within the A-1a district with an approved County Use Permit. However, as noted in Section 4.1 above, the project site is also located within the State Land Use Agricultural District; therefore a Special Permit, pursuant to HRS 205, rather than a Use Permit would be required to implement the proposed project.

4.6 Hawai‘i Cave Protection Law
The purpose of the Hawai‘i Cave Protection Law is to protect the unique cultural and natural resources found in Hawaii’s caves. As a known and previously identified cave, Kāumāna Cave is covered by this law. The Proposed Action would be implemented in conformance with all applicable provisions of the Cave Protection Law. The Proposed Action would maintain a minimum 100-foot buffer, as measure from the outer edges of the cave. With adherence to this buffer, it is anticipated that the Proposed Action would result in no significant adverse impacts on Kāumāna Cave. For previously unknown caves that are encountered during a normal construction context, the provisions of this law do not apply, provided that the protective and mitigation measures identified during the environmental review process and permitting conditions are followed.
5.0 FINDINGS AND DETERMINATION

5.1 Significance Criteria
This EA evaluates the impacts that potentially could result from implementing the Proposed Action. Short- and long-term impacts were looked at, as well as direct, indirect, and cumulative impacts. Potential impacts were evaluated against the criteria contained in §11-200-12 of the DOH rules relating to Environmental Impact Statements. Mitigation is proposed where appropriate.

1. The proposed project will not involve an irrevocable commitment, loss or destruction of any natural or cultural resources.
No natural or cultural resources would be committed or lost. Some vegetation removal would be needed to develop the school campus; however, the biological survey concluded that there is nothing unique about the project site. There is an abundance of similar habitats in, and around Hilo. Further there is no federally delineated Critical Habitat within or near the project site. An archaeological field inspection of the surface area and the field inspection of Kaūmana Cave encountered no archaeological/cultural sites or historic elements within the project site that would be adversely impacted by the project.

2. The proposed project will not curtail the range of beneficial uses of the environment.
The Proposed Project would not curtail any beneficial use of the environment. The project site is currently undeveloped and no recreational or cultural uses of the site have been identified, except for the occasional pig hunter. Due to the redesign of the campus to avoid Kaūmana Cave, it is expected that this environmental resource would not be impacted by the Proposed Action. Further, Connections has no intention of limiting other people’s access to the cave for recreational, research, and educational purposes. This is particularly true when considering the proposed sustainable agriculture program that Connections is proposing to implement upon securing the long-term lease to the property.

3. The proposed project will not conflict with the state’s long-term environmental policies.
The state’s long-term environmental policies are set forth in Chapter 344, HRS. The broad goals of the policy are to conserve natural resources and enhance the quality of life. This project fulfills aspects of these policies by providing by providing the local community with modern educational facilities, thus enhancing the community’s quality of life. As a “green” project, development of the new Connections campus will satisfy the intent of these policies by, among other things, reducing potable water demand through the use of water efficient fixtures, a rainwater catchment system and recycled water; reducing electrical demand by use of photovoltaics and other energy reduction features; and designing the facilities to minimize disruption to the native forest.

4. The proposed project will not substantially affect the economic or social welfare of the community or state.
The Proposed Action is not expected to have any adverse socio-economic effects. On the contrary, over time the Proposed Action should result in beneficial impacts to the social welfare of the community by providing a unique educational opportunity for the community’s children and by providing design and construction jobs for local residents.
5. The proposed project does not substantially affect the public health in any detrimental way. The Proposed Actions would have no detrimental effects on public health. Adherence to all applicable regulations and guidelines in designing, constructing and operating the rainwater catchment system, wastewater system, and recycled water system should ensure that public health would not be adversely affected.

6. The proposed project will not involve substantial secondary impacts such as population changes or effects on public facilities.
No secondary effects are anticipated to result from the Proposed Action, which would improve educational facilities in the Hilo area. The Proposed Action would not induce in-migration or adversely affect public facilities.

7. The proposed project will not involve a substantial degradation of environmental quality.
Connections intends for their new campus to be a model of sustainability. As mandated by the State, the project would need to be certified as LEED Silver; however, the goal is to obtain a higher LEED rating (i.e., gold or platinum). Project features that reduce greenhouse gas emissions, reduce energy use, and reduce potable water consumption in combination with utilization of alternative energy and water sources would all contribute to minimizing any potential degradation of environmental quality. Further low impact development strategies would be implemented to reduce and manage runoff from the site. Therefore, the Proposed Actions is expected to be environmentally benign and would not contribute to any substantial environmental degradation.

8. The proposed project will not substantially affect any rare, threatened or endangered species of flora or fauna or habitat.
It is expected that the construction or operation of the Proposed Action would not result in deleterious impacts to native plant or animal species within the general project area. There are no protected, rare, or endangered plant species with the project site. Further, there is nothing unique about the project site or its vegetation and there is abundant like habitat in, and around Hilo. During a biological survey of the project site none of the following species were observed, although they are known to be in the general area: Hawaiian Hoary Bats, Hawaiian Hawks, Hawaiian Petrels or Newell's Shearwaters.

The following summarizes protective measures to minimize any potential impacts to the Hawaiian Hoary Bat, the Hawaiian Hawk, the Hawaiian Petrel, and Newell's Shearwater. These measures are discussed in detail in Section 3.5.2 above.

- Clearing and grubbing not be undertaken during the Hawaiian hoary bats’ birthing and pup rearing season. If clearing is to be conducted during this period, a survey should be conducted to verify if bats are present.
- Tree clearing should be avoided during the Hawaiian Hawks’ breeding season from March to September. If clearing must be conducted during this period, a survey should be conducted to verify if any Hawaiian Hawks are present.
- To reduce the potential for interactions between nocturnally flying Hawaiian Petrels and Newell’s Shearwaters with external lights and man-made structures, it is recommended that any external lighting be shielded.
9. The proposed project is not one, which is individually limited but cumulatively may have considerable effects upon the environment or involves a commitment for larger actions. The project is not related to additional activities in the region in such a way as to produce adverse cumulative effects or involve a commitment for larger actions. Cumulative traffic impacts have been accounted for in the analysis and recommendations of the TIAR.

10. The proposed project will not detrimentally affect air or water quality or ambient noise levels.

No adverse effects on these resources will occur. Adherence to applicable regulations, construction site BMPs and permit conditions should prevent any adverse impacts to water, air and noise quality. Disturbance during the construction phase would be temporary and limited to reasonable daytime hours. Runoff would be controlled to prevent any water quality issues.

11. The project does not affect or would it likely to be damaged as a result of being located in environmentally sensitive area such as a flood plain, tsunami zone, erosion-prone area, geologically hazardous land, estuary, fresh water, or coastal waters.

The project site is located in an area with volcanic and seismic risks, as is the entire Island of Hawai‘i. The Proposed Action would construct and employ design and construction standards appropriate for the seismic zone. Currently, there are no mitigation measures for volcanic hazards that have proven to be effective. While the project site is not located in a flood plain or a FEMA-designated flood zone, it may be subject to occasional flooding from Ka‘u‘u Cave. These instances are rare and protective design features would be incorporated into the project. Such features could include diverting surface runoff away from buildings and into detention basins or drywells and designing facilities to be elevated above ground level. Specific and appropriate project features will be identified during the design development phase of the project. The project site is not located in any other environmentally sensitive area.

12. The project will not substantially affect scenic vistas and view planes identified in the county or state plans or studies.

No scenic view planes identified in the Hawai‘i County Plan would be adversely affected by the project. Further, the buildings would be single story and small in scale. Vegetation (e.g., trees and shrubs) would be used as a visual buffer so that school facilities would not be glaringly noticeable from public streets.

13. The project will not require substantial energy consumption.

Initial construction of the facility will require additional consumption of energy. In the long-term, once the campus is built, sustainable design features would reduce energy consumption during operation of the school facilities. Alternative energy sources such as wind and photovoltaics are being considered and would be installed if economically feasible. There would be no long-term adverse effects on the existing energy utilities servicing the area.

5.2 Determination

Based on the evaluation contained in this EA, DLNR does not anticipate that the Conceptual Master Plan for Connections Public Charter School would result in significant adverse impacts to the existing natural or human environment. Therefore, DLNR has issued a Finding of No Significant Impact for the master plan.
This Page is Intentionally Blank.
6.0 CONSULTATION AND COORDINATION

In an effort to solicit comments on the Proposed Action, pre-assessment informational letters were sent to the government agencies and private organizations identified in Appendix A. Response letters that were received are reproduced in Appendix A as well. Thirteen responses letters were received.

The original Draft EA was distributed for agency and public comment in August 2009. The distribution list and reproductions of the comment letters and responses are attached in Appendix B. Fourteen agency response letters and five individual response letters were received. Due to the nature of the comments received regarding potential impacts to Kaūmana Cave, it was decided that the most prudent course of action was to reconfigure the campus plan to avoid the cave and any potential impacts.

This Revised Draft EA assesses the potential impacts of the reconfigured campus plan and is being distributed for agency and public comment. Comment letters and responses to this Revised Draft EA are appended to the Final EA as Appendix C.
This Page is Intentionally Blank.

Subject: Early Consultation Request for a Proposed New Century Public Charter School, South Hilo, Hawaii

Dear Ms. Mariant:

This letter is in response to your request for early consultation on a proposed project to build a New Century Public Charter School in Kaunana, in the District of South Hilo on the island of Hawaii. We received your letter on February 4, 2009. The proposed project will consist of leasing 72 acres of land and building three schools: an elementary, intermediate and a High School.

Based on information in our files, including data compiled by the Hawaii Biodiversity and Mapping Program, and the Hawaii GAP Program, the endangered Hawaiian hoary bat (Lasiurus cinereus semotus) and the endangered Hawaiian hawk (Buteo solitarius) may occur in the project vicinity. There is no federally designated critical habitat near the project site.

In preparing your draft Environmental Assessment, we recommend you address potential project impacts to the Hawaiian hoary bat and the Hawaiian hawk and we offer the following measures to assist you in avoiding and minimizing potential impacts to these species:

- Hawaiian hoary bats roost and give birth in both exotic and native woody vegetation. However, use of the project area by Hawaiian hoary bats is currently unknown. To avoid potential impacts to this species, no woody plants suitable for bat roosting should be removed or trimmed during the bat birthing and pup rearing season (July through September). If you must clear the property during the Hawaiian hoary bat pupping season, we recommend conducting biological surveys to determine if bats are present. Please contact our office regarding survey methodology.

- Hawaiian hawks nest in both exotic and native woody vegetation. To avoid impacts to Hawaiian hawks, we recommend avoiding tree clearing during the breeding season from March through September. If you must clear the property during the Hawaiian hawk breeding season, we recommend conducting biological surveys to determine if hawk nests are present.

Thank you for the opportunity to assist you with your proposed project. If you have any questions regarding this letter, please contact Dr. Jeff Zimpfer, Fish and Wildlife Biologist, Consultation and Technical Assistance Program (phone: 808-586-9431; email: jeff_zimpfer@fws.gov).

Sincerely,

Christa Reeser
Field Supervisor

Subject: Early Consultation for Draft Environmental Assessment for Connections New Century Public Charter School, Hilo, Hawaii

File No.: NA
TMK No.: (3) 2-5-61141

Thank you for the opportunity to review the subject document. The Commission on Water Resource Management (CWRM) is the agency responsible for administering the State Water Code (Code). Under the Code, all waters of the State are held in trust for the benefit of the citizens of the State, therefore, all water use is subject to legally protected water rights. CWRM strongly promotes the efficient use of Hawaii’s water resources through conservation measures and appropriate resource management. For more information, please refer to the State Water Code, Chapter 174C, Hawaii Revised Statutes, and Hawaii Administrative Rules, Chapter 13-171. These documents are available via the internet at http://www.hawai.gov/cwrwm.

Our comments related to water resources are checked off below.

☐ 1. We recommend coordination with the county to incorporate this project into the county’s Water Use and Development Plan. Please contact the respective Planning Department and/or Department of Water Supply for further information.

☐ 2. We recommend coordination with the Engineering Division of the State Department of Land and Natural Resources to incorporate this project into the State Water Projects Plan.

☐ 3. We recommend coordination with the Hawaii Department of Agriculture (HDOA) to incorporate the reclassification of agricultural land and the modification of agricultural resources into the State’s Agricultural Water Use and Development Plan (AWUDP). Please contact the HDOA for more information.

☐ 4. We recommend that water efficient fixtures be installed and water efficient practices implemented throughout the development to reduce the increased demand on the area’s freshwater resources. Reducing the water usage of a house or building may earn credit towards Leadership in Energy and Environmental Design (LEED) certification. More information on LEED certification is available at http://www.usgbc.org. A listing of fixtures certified by the EPA as having high water efficiency can be found at http://www.epa.gov/waterefficiency/index.htm.

☐ 5. We recommend the use of best management practices (BMP) for stormwater management to minimize the impact of the project to the existing area’s hydrology while maintaining on-site infiltration and preventing polluted runoff from storm events. Stormwater management BMPs may earn credit toward LEED certification. More information on stormwater BMPs can be found at http://www.epa.gov/lnnhw/bmp/revised initialise/ED/.

☐ 6. We recommend the use of alternative water sources, wherever practicable.

☐ 7. These may be the potential for ground or surface water degradation/contamination and recommended that approvals for this project be conditioned upon a review by the State Department of Health and the developer’s acceptance of any resulting requirements related to water quality.

Permit needed by CWRM:
Additional information and forms are available at http://www.hawaii.gov/cwrwm/permits.html.

☐ 8. A Well Construction Permit(s) is (are) required any well construction work begins.

☐ 9. A Pump Installation Permit(s) is (are) required before ground water is developed as a source of supply for the project.

☐ 10. A Water Use Permit(s) is (are) required before a well is developed or a well is used for the project.

☐ 11. A Groundwater Withdrawal Permit(s) is (are) required before water is withdrawn from the project area.

☐ 12. A Stream Channel Alteration Permit(s) is (are) required before any alteration(s) is made to the bed and/or banks of a stream channel.

☐ 13. A Stream Diversion Works Permit(s) is (are) required before any stream diversion works is (are) constructed or altered.

☐ 14. A Petition to Amend the Intake/Norm Flow Standard is required for any new or expanded diversion(s) of surface water.

☐ 15. The planned source of water for this project has not been identified in this report. Therefore, we cannot determine what permits or petitions are required from our office, or whether there are any potential impacts to water resources.

OTHER:
The project information document indicates that water will be provided through the Department of Water Supply municipal system. We recommend that the Draft Environmental Assessment (DEA) quantify the possible and non-potable needs for the project, and whether there are any available alternative sources of non-potable water. Waipio Stream is in the vicinity of the project, and any potential impacts to this stream should be disclosed.

If there are any questions, please contact Lauren Choy at 808-224-0165.

Judy Marlaat
Wil Choo Planning & Environmental
1018 Palm Drive
Honolulu, Hawaii 96814

Dear Ms. Marlaat:

SUBJECT: Chapter 60-8 Historic Preservation Review — Request for Comment on Various Permits Associated with the New Construction/Establishment of the Connections New Century Public Charter School Kaumana & Alapana 2'nd Ahupua'a, South Hilo District, Island of Hawaii

Thank you for the opportunity to comment on the aforementioned project, which we received on February 3, 2009. The entire property is within the 1889-1891 lava flow. A bench of the Kaumana lava tube complex passes underneath a portion of this site; care should be taken when planning construction in this area as there are known burials within other portions of this system and there is the potential of historic properties being located within the lava tube under this property.

We determine that no historic properties will be affected by this project because:

☐ Intensive cultivation has altered the land
☐ Residential development/urbanization has altered the land
☐ Previous grubbing/grading has altered the land
☐ An accepted archaeological inventory survey (AIS) found no historic properties
☐ SHPO previously reviewed this project and mitigation has been completed
☐ Other: Plus parcel is entirely within the 1889-1891 lava flow.

In the event that historic resources, including human skeletal remains, cultural materials, lava tubes, and lava boulders are identified during the construction activities, all work needs to cease in the immediate vicinity of the find, the find needs to be protected from additional disturbance, and the State Historic Preservation Division, Hawaii Island Section, needs to be contacted immediately at (808) 933-7653.

If you have questions about this letter please contact Morgan Davis at (808) 933-7650.

Sincerely,

Nancy A. McMahon
Deputy SHPO/State Archaeologist
and Historic Preservation Manager

Dear Mr. Cheo:

Subject: Connections New Century Public Charter School
Early Consultation (EC)

Thank you for providing the subject project for the State Department of Transportation’s (DOT) review and comments.

DOT understands that the proposed project involves the consolidation and construction of three schools at the same location and that access to the site is from Kaumana Drive.

DOT Highways Division recommends that a Traffic Impact Assessment Report (TIAR) be done for the subject project to determine the impacts of the 361-student school. The TIAR should also recommend appropriate measures to mitigate project-generated impacts.

If there are any questions, please contact Mr. David Shimokawa of the DOT Statewide Transportation Planning Office at (808) 387-2356.

Very truly yours,

Francis Paul Keene

RE: Connections New Century Public Charter School
Manahoa Highway
South Hilo, Hawai‘i

Dear Ms. Maraint,

We offer the following comments:

**Solid Waste Division**

If components of a Solid Waste Management Plan are included in the Environmental Assessment, it will not be necessary to submit one at a later date.

**Wastewater**

There are no county sewers in area of this project.

Please add our department to your list of agencies to be consulted during the preparation of the Draft Environmental Assessment. Thank you for allowing us to review and comment on this project.

Sincerely,

[Signature]

Loa A. Tyron

vehicle movements and associated routes that will be used to transport the waste and
recycled materials.
4. The report will include identification of any impacts to County-operated waste
management facilities, and the appropriate mitigation measures that will be implemented
by the development to minimize these impacts.
5. Analysis will be based on the highest potential use or zoning of the development.

REQUIREMENTS AND CONDITIONS
1. A solid waste management plan will be prepared for all commercial developments, as
defined under the policies of the Department of Environmental Management, Solid
Waste Division.
2. The Department of Environmental Management will require the developer to provide or
resolve all recommendations and mitigation measures as outlined in the solid waste
management plan; besides any conditions placed on the applicant herein.
3. A State of Hawaii licensed engineer will draft and certify in writing the solid waste
management plan as complying with applicable Federal, State and County of Hawaii
solid waste laws, regulations, and administrative rules.

Should you require additional information, please contact Michael Dworsky, P.E., Solid Waste
Division Chief at 808-881-0515.

TAX MAP KEY 2-5-806-141

This is in response to your February 2, 2009 Pre-Environmental Consultation letter.

Water is available from an existing 3-inch waterline within Kauamna Drive and from an existing 3-inch
waterline within Edita Street, both flowing the subject parcel.

Please be informed that the current water availability conditions in the area, which are subject to change, are
limited to a maximum of seven (7) units of water per pre-existing lot of record. Each unit of water is equal to a
maximum usage of 600 gallons per day (GPD); therefore, a maximum of 4,200 GPD is available for the
proposed project.

The Department will request maximum daily water usage calculations, prepared by a professional engineer
licensed in the State of Hawaii, showing the estimated water demand for the proposed project. If the estimated
maximum daily water usage for the proposed elementary, intermediate, and high schools exceeds 4,200 GPD,
the Department’s existing water system cannot support the project and extensive improvements would be
required. The improvements may include, but not be limited to, additional source and storage facilities.

Further, any meter(s) serving the subject parcel shall have a reduced pressure type backflow prevention
assembly installed within five (5) feet of the meter on private property before water service can be activated.

The existing 3-inch waterline within Edita Street is looped and therefore adequate to provide the required 2,000
gallons per minute fire flow, as per the Department’s Water System Standards for schools.

Should there be any questions, you may contact Mr. Finn McColl of our Water Resources and Planning Branch
at 961-8076, extension 355.

Sincerely yours,

Milton P. Puno, P.E.
Manager

Dear Ms. Mariant,

SUBJECT: CONNECTIONS NEW CENTURY PUBLIC CHARTER SCHOOL
SOUTH HILO, HAWAII

In regards to the above-mentioned environmental assessment, the following shall be in accordance:

Fire apparatus access roads shall be in accordance with UFC Section 10.207:

"Fire Apparatus Access Roads"

"Sec. 10.207. General. Fire apparatus access roads shall be provided and maintained in accordance with the provisions of this section.

"(a) Where Required. Fire apparatus access roads shall be required for every building hereafter constructed when any portion of an exterior wall of the first story is located more than 150 feet from fire department vehicle access as measured by an unobstructed route around the exterior of the building.

*EXCEPTIONS: 1. When buildings are completely protected with an approved automatic fire sprinkler system, the provisions of this section may be modified.

2. When access roadways cannot be installed due to topography, waterways, non-negotiable grades or other similar conditions, the chief may require additional fire protection as specified in Section 10.301 (b).

3. When there are not more than two Group R2, Division 3 or Group M Occupancies, the requirements of this section may be modified, provided, in the opinion of the chief, fire-fighting or rescue operations would not be impaired.

"More than one fire apparatus road may be required when it is determined by the chief that access by a single road may be impaired by vehicle congestion, conditions of terrain, climatic conditions or other factors that could limit access.

"For high-sided combustible storage, see Section 3.109.

"(c) Width. The unobstructed width of a fire apparatus access road shall meet the requirements of the appropriate county jurisdiction.

Hawaii County is an Equal Opportunity Provider and Employer.

[Signature]
Darryl J. Oliviera
Fire Chief
February 15, 2009

[Signature]
Ms. Judy Mariant
Page 2
February 15, 2009

"(d) Vertical Clearance. Fire apparatus access roads shall have an unobstructed vertical clearance of not less than 12 feet 6 inches.

*EXCEPTION: Upon approval vertical clearance may be reduced, provided such reduction does not impair access by fire apparatus and approved signs are installed and maintained indicating the established vertical clearance.

"(e) Permissible Modifications. Vertical clearances or widths required by this section may be increased when, in the opinion of the chief, vertical clearances or widths are not adequate to provide fire apparatus access.

"(f) Surface. Fire apparatus access roads shall be designed and maintained to support the imposed loads of fire apparatus and shall be provided with a surface so as to provide all-weather driving capabilities." (20 tons)

"(g) Turning Radius. The turning radius of a fire apparatus access road shall be as approved by the chief." (45 feet)

"(h) Turnarounds. All dead-end fire apparatus access roads in excess of 150 feet in length shall be provided with approved provisions for the turning around of fire apparatus.

"(i) Bridges. When a bridge is required to be used as access under this section, it shall be constructed and maintained in accordance with the applicable sections of the Building Code and using approved fire load carrying floor joists and floor framing sufficient to carry the imposed loads of fire apparatus.

"(j) Grade. The grade for a fire apparatus access road shall not exceed the maximum approved by the chief." (15%)

"(k) Obstruction. The required width of any fire apparatus access road shall not be obstructed in any manner, including parking of vehicles. Minimum required widths and clearances established under this section shall be maintained at all times.

"(l) Signs. When required by the fire chief, approved signs or other approved devices shall be provided and maintained for fire apparatus access roads to identify such roads and prohibit the obstruction thereof, or both.

Water supply shall be in accordance with UFC Section 10.301(c):

"(e) Water Supply. An approved water supply capable of supplying required fire flow for fire protection shall be provided by all premises upon which buildings or portions of buildings are hereafter constructed, in accordance with the respective county water requirements. There shall be provided, when required by the chief, on-site fire hydrants and mains capable of supplying the required fire flow.

"Water supply may consist of reservoirs, pressure tanks, elevated tanks, water main or other fixed systems capable of providing the required fire flow.

"The location, number and type of fire hydrants connected to a water supply capable of delivering the required fire flow shall be approved as set forth by the respective county water requirements. All hydrants shall be accessible to the fire department apparatus by roadways meeting the requirements of Section 10.307.

Subject: Draft Environmental Assessment for Connections Public Charter School Master Plan, South Hilo, Hawai‘i, TMK (3) 2-5-006:141

Dear Mr. Coary,

We have received your memorandum dated August 26, 2009 informing us that you have no objections to the project. Thank you for participating in the environmental review process with us.

Due to the nature of other comments we received on the Draft EA, Connections Public Charter School (CPCS) and Wil Chee – Planning & Environmental (WCP) have decided to reconfigure the site plan for this project. Concern was expressed from speleologists, members of the scientific community, and other interested persons that the Draft EA did not adequately address potential environmental impacts on Kainama Cave resulting from the proposed project. After further research and review, it was determined that reconfiguring the campus layout to avoid the cave and any potential conflicts was prudent.

Therefore, CPCS and WCP are preparing a Revised Draft EA for this project, which will address the modified campus layout, any potential effects on Kainama Cave and mitigation measures, as warranted. We will provide your agency with a copy of the Revised Draft EA upon its completion.

Sincerely,

Celia Shen

Subject: Draft Environmental Assessment for Connections Public Charter School Master Plan, South Hilo, Hawai‘i, TMK (3) 2-5-0065141

Dear Mr. Hirano,

Thank you for your comments dated August 3, 2009 concerning the subject Draft EA. We acknowledge that your February 10, 2009 Pre-Consultation comments, in which you confirm the project site's location in Zone X according to the Flood Insurance Rate Map, are still applicable.

Water demands and calculations will be provided to the Engineering Division to be included in the State Water Projects Plan Update when they become available.

Due to the nature of other comments we received on the Draft EA, Connections Public Charter School (CPCS) and Wil Chee – Planning & Environmental (WCP) have decided to reconfigure the site plan for this project. Concern was expressed from spoilologists, members of the scientific community, and other interested persons that the Draft EA did not adequately address potential environmental impacts on Kaliauna Cave resulting from the proposed project. After further research and review, it was determined that reconfiguring the campus layout to avoid the cave and any potential conflicts was prudent.

Therefore, CPCS and WCP are preparing a Revised Draft EA for this project, which will address the modified campus layout, any potential effects on Kaluauna Cave and mitigation measures, as warranted. We will provide your agency with a copy of the Revised Draft EA upon its completion.

Sincerely,

Celia Shen

MEMORANDUM

TO:Morris M. Ata, Land Division
    P.O. Box 621
    Honolulu, Hawai‘i 96809

FROM:Pat Aiu, Administrator

SUBJECT:Chapter 65-7 and 65-8 Historic Preservation Review
          Draft Environmental Assessment, Connections New Century Public Charter School
          Pualu Kaua‘i Academy, South Hilo District, Island of Hawai‘i

Log No. 2009.3291
Doc No. 0909TD24

Thank you for requesting our comments regarding the subject DEA, which was received in our office August 17, 2009. The proposed project involves the construction of a new public charter school campus encompassing approximately 72 acres on state-owned land. The campus is divided into two sections (upper and lower) by the existing Eiola Street.

Our office has previously commented on this project in a February 17, 2009 letter to Judy Mauditt of Will Choe Planning (Log 2009.0929, Doc 09020323). In this correspondence, we indicated that there were no known historic properties within the project area, but that a branch of the Kānīnānai lava tube complex runs beneath a portion of the project area and that, "...there is the potential of historic properties being located within the lava tube under this property." We recommended that care be taken when planning construction in the area overlapping the lava tube. The plans presented in the EA indicate that several buildings may be directly over or very close to the cave. Information provided in Dr. Stone's testimony dated September 4, 2009, suggests that usage of the cave may have begun shortly after its formation circa 1851. If use occurred during the early twentieth century, we believe it is important to document the nature of that use, and to ensure that if significant historic sites are present, that they be afforded appropriate mitigation measures and/or preservation prior to the onset of construction activities that could cause collapse.

Attached to the DEA is a report entitled Archaeological Assessment Survey of the Connections Charter School Kānīnānai Property, South Hilo District, Island of Hawai‘i, (Crew and Claghet 2008). The fieldwork described in this report found no evidence of historic properties within the project area; however, the study did not include an examination of the portion of the Kānīnānai Cave that runs beneath the upper campus area. We did not have an opportunity to review this assessment report prior to its publication in the DEA.

We cannot make an accurate determination of project effects until after the archaeologists return to the project area and conduct a more thorough investigation of the Kānīnānai Cave beneath the project area. We are sending a letter to the consulting firm requesting additional fieldwork and revisions to the assessment report. We also recommend that the DEA be revised to include accurate information regarding the presence/absence of historic properties within the cave. Please contact Theresa Dunham at (808) 933-7653 if you have any questions or concerns.

Depl. of Land and Natural Resources, State Historic Preservation Division
601 Kamokila Boulevard, Room 555
Kapolei, HI 96707

Subject:Draft Environmental Assessment for Connections Public Charter School Master Plan,
         South Hilo, Hawai‘i, TMK (3) 2-5-006:141

Dear Ms. Aiu,

Thank you for your comments dated September 24, 2009 concerning the subject DEA. Due to the nature of other comments we received, Connections Public Charter School (CPCS) and Will Choe Planning & Environmental (WCP) have decided to reconfigure the site plan for this project. Concern was expressed from archaeologists, members of the scientific community, and other interested persons that the Draft EA did not adequately address potential environmental impacts on Kānīnānai Cave resulting from the proposed project. After further research and review, it was determined that reconfiguring the campus layout to avoid the cave and any potential conflicts was prudent.

Development of major school facilities are now being proposed within the lower portion of the parcel, below Eiola Street. While a small segment of Kānīnānai Cave may underlie a portion of the lower parcel's northern corner, indications are that this segment was closed off when Eiola Street was constructed in the 1930's and is likely inaccessible. Due to safety and other concerns, the revised campus plan will maintain a minimum 100-foot buffer between any school facility and the cave.

We have reviewed your request to conduct additional fieldwork, specifically to investigate the presence or absence of historic properties within Kānīnānai Cave. CPCS and WCP currently are working with our consulting archaeologist to have this investigation completed.

CPCS and WCP are preparing a Revised Draft EA for this project, which will address the modified campus layout, any potential effects on Kānīnānai Cave and mitigation measures, as warranted. We will provide your agency with a copy of the Revised Draft EA upon its completion. Thank you for participating in the environmental review process with us.

September 2, 2009

Celia Shen
Wil Choo Planning and Environmental
1018 Palu Drive
Honolulu, HI 96814

Aloha e Celia Shen,

The Office of Hawaiian Affairs (OHA) is in receipt of your letter requesting comments on the above-mentioned project. Connections New Century Public Charter School Master Plan proposes to construct a new campus on 72 acres of vacant, state-owned land in South Hilo, Hawai‘i Island. About 12.5 acres of the site would be built upon to include roads, parking, fields, gardens, an administrative center, cafeteria, classrooms and dormitory. The school is expected to serve fewer than 500 students. OHA has reviewed the project and offers the following comments.

The applicant states that a previous Cultural Impact Assessment for a separate project concluded that there was no evidence that traditional cultural practices are conducted at the project site. However, this CIA was not included in the DEA’s appendix. OHA requests the opportunity to review the CIA, which apparently was completed for the Pauinako Street Extension and Widening project. We ask whether recent interviews of cultural practitioners have been conducted or if the applicant planning to completely rely on a CIA that appears to be more than 10 years old. We note that the pictures in the archaeological assessment appear to show trails going through the forest on the project site. These trails may be used by cultural practitioners.

OHA appreciates that an archaeological monitor will be called on site to inspect any previously undiscovered lava tubes encountered during construction activities. We recommend that if a lava tube is discovered, construction activities around the lava tube should be stopped until an archaeological monitor can inspect the tube. We agree with the archaeological assessment that such lava tubes have the potential to contain cultural deposits or Native
Hawaiian remains. If construction activities are allowed to continue around the lava tube before an archaeological monitor arrives to inspect it, the tube may collapse endangering whatever may be inside. We will rely on the applicant's assurances that should iwi kipu reinforce Native Hawaiian cultural or traditional deposits be found during the construction of the project, work will cease, and the appropriate agencies will be contacted pursuant to applicable law.

The applicant indicates that it will preserve much of the native forest found on the project site by incorporating the forest into the school design. We applaud this design concept and request further information regarding exactly how much of the forest will be impacted by the project. We recommend that the applicant consider replanting native plants removed from the site to other areas. While the native forests found on the project site are not endangered, they are still valuable, precious, and becoming increasingly rare with the urbanization of our islands. OHA further suggests that any native plants that cannot be replanted be offered to local practitioners for use. In addition, we appreciate that the applicant plans to conduct reforestation efforts at the project site by planting koa and kōpūa.

Further, OHA notes that the subject land is designated as Section 5 (q) Ceded Lands, which hold a considerable amount of sentimental, historical, and legal significance for Native Hawaiians and OHA. These lands were illegally taken from the Hawaiian Kingdom after the 1893 overthrow and later transferred ("ceded") by the United States government to the State of Hawai'i upon statehood. Today, the state holds the Ceded Lands corpus in trust for Native Hawaiians and the general public. OHA requests that the Ceded Lands status of the project site be clearly indicated in the Final EA. Identifying and documenting Ceded Lands in such a manner will help with the creation of a comprehensive Ceded Lands inventory.

Thank you for the opportunity to comment. If you have further questions, please contact Sterling Wong by phone at (808) 594-0248 or e-mail him at sstirlingw@oha.org.

Subject: Draft Environmental Assessment for Connections Public Charter School Master Plan,
South Hilo, Hawai'i, FMK (2) 2-5-096:141

Dear Mr. Nānua’o,

Thank you for your comments dated September 2, 2009 concerning the subject Draft EA. Due to the nature of other comments we received, Connections Public Charter School (CPCS) and Wil Chee -- Planning & Environmental (WCP) have decided to reconfigure the site plan for this project. Concern was expressed from speleologists, members of the scientific community, and other interested persons that the Draft EA did not adequately address potential environmental impacts on Kaimana Cave resulting from the proposed project. After further research and review, it was determined that reconfiguring the campus layout to avoid the cave and any potential conflicts was prudent.

Development of major school facilities are now being proposed within the lower portion of the parcel, below Edits Street. While a small segment of Kaimana Cave may underlie a portion of the lower parcel's southern corner, indications are that this segment was closed off when Edits Street was constructed in the 1950s, and is likely inaccessible. Due to safety and other concerns, the revised campus plan will maintain a minimum 100-foot buffer between any school facility and the cave.

Therefore, CPCS and WCP are preparing a Revised Draft EA for this project, which will address the modified campus layout, any potential effects on Kaimana Cave and mitigation measures, as warranted. We will provide your agency with a copy of the Revised Draft EA upon its completion.
In response to your comments we offer the following:

Comment #1: Concern about a more recent Cultural Impact Study (CIS) not being included for the site for this proposed project. We ask whether recent interviews of cultural practitioners have been conducted and if the applicant planning to completely rely on a CIS that appears to be more than 10 years old. The previous CIS is over 10 years old. Photographs of the site show trails on the project site, which may have been used by cultural practitioners.

CPC and WCP will attempt to update the findings of the CIS conducted for the Pasifico Street Extension, the study area of which encompassed the subject property. Organizations and individuals are being contacted that may be able to assist in ascertaining if the project would impact any traditional cultural properties or practices. The trails which are shown in photographs were cut by CPC personnel to facilitate conducting the archaeological and biological surveys of the property. They were not cut by cultural practitioners and did not exist prior to being cut by CPC personnel.

Comment #2: Appreciation expressed that an archaeological monitor will be called on site to inspect any previously undiscovered lava tubes that may be uncovered during construction.

We acknowledge your comments regarding precautionary measures when conducting construction activities in the vicinity of caves and lava tubes. CPC remains committed to developing this project in a responsible manner and the precautionary measures contained in the Draft EA will be carried over to the Revised Draft EA.

Comment #3: Appreciation expressed at the efforts to preserve as much of the native forest as possible on the site, and to replant native plants on the project site. Request that information be provided regarding how much of the native forest would be impacted by the project and that any native plants to be removed be offered to cultural practitioners.

Due to the reconfigured campus plan, it is expected that there would be little to no adverse impact on the native ‘ōhi’a forest on the property’s upper parcel as development of the school’s major facilities would be limited to lower parcel, below Edina Street. The lower parcel is characterized primarily by a variety of weeds and nonnative plant species. Potential impacts of the reconfigured campus site plan may have on the native forest and native plants will be addressed in the forthcoming Revised Draft EA, including an estimate of how much native forest would be impacted, if warranted. We acknowledge your comments that any native plant species removed during development should be replanted elsewhere or offered to cultural practitioners. Thank you for bringing this idea to our attention.

Comment #4: OHA notes that the subject land is designated as Section 5(b) Ceded Lands, which hold a considerable amount of sentimental, historical, and legal significance. Request that the Ceded Land status of the project site be clearly indicated in the Final EA, to assist in the creation of a comprehensive Ceded Land inventory.

DRAFT ENVIRONMENTAL ASSESSMENT
CONNECTIONS NEW CENTURY PUBLIC CHARTER SCHOOL
TAX MAP KEY 3-5-006:141

We have reviewed the subject Draft Environmental Assessment (DEA) and have no further comments at this time. We have no objection to the proposed project, subject to the applicant understanding that we can only provide a maximum of 4,000 gallons per day.

Our comments from our March 18, 2009 Pre-Environmental Assessment Consultation letter, which was included in the DEA, still stand.

Should there be any questions, you may contact Mr. Finn McCall of our Water Resources and Planning Branch at 961-8070, extension 235.

Sincerely yours,

Mr. Morris Atta
Land Division
Department of Land and Natural Resources
State of Hawai‘i
1151 Punchbowl Street, Room 220
Honolulu, HI 96813

Dear Mr. Atta:

Subject: Comments on Draft Environmental Assessment
Project: Connections New Century Public Charter School Master Plan
TMK: (3) 2-6-0966141; Panahawai and Kīkīkau 2nd, South Hilo, Hawaii

This letter is prepared in response to correspondence dated July 27, 2009, providing this office with a copy of a Draft Environmental Assessment (DEA) prepared pursuant to Hawai‘i Revised Statutes, Chapter 343 and Administrative Rules, Title 11, Chapter 260.

The Connections New Century Public Charter School is proposing to open a new campus to include the pre-k, elementary, intermediate, and high school campus on one parcel. Connections is pursuing a land lease with the current property owner, the State of Hawai‘i.

The subject property is zoned AG-1a (Agricultural-minimum 1 acre lot size) and is situated within the State Land Use Agricultural District. In addition, according to the County of Hawai‘i General Plan 2005 (amended December 2006); the subject property is designated as Low Density Urban by the Land Use Pattern Allocation Guide. The parcel is not located in the Special Management Area.

The DEA for Connections New Century Public Charter School Master Plan has been reviewed by this office and we offer the following comments:

The DEA incorrectly states that the County of Hawai‘i General Plan LUAG designation for the subject parcel is Urban Expansion. Please note that the correct designation is Low Density Urban. We have no further comments to offer at this time. If you have any questions or if you need any assistance, please feel free to contact Bethany Morrison of this office at 961-8138.

Sincerely,

B.J. Leithead Todd

Subject: Draft Environmental Assessment for Connections Public Charter School Master Plan, South Hilo, Hawai‘i, TMK (3) 2-5-0065141

Dear Ms. Leithead Todd,

We have received your comments dated August 12, 2009 concerning the subject Draft EA. Thank you for providing us with updated information regarding the subject property. We have noted the change in the EA that the subject property is designated as Low Density Urban, not Urban Expansion.

Due to the nature of other comments we received on the Draft EA, Connections Public Charter School (CPCS) and Wil Chee – Planning & Environmental (WCP) have decided to reconfigure the site plan for this project. Concern was expressed from spelunkers, members of the scientific community, and other interested persons that the Draft EA did not adequately address potential environmental impacts on Kāumana Cave resulting from the proposed project. After further research and review, it was determined that reconfiguring the campus layout to avoid the cave and any potential conflicts was prudent.

Therefore, CPCS and WCP are preparing a Revised Draft EA for this project, which will address the modified campus layout, any potential effects on Kāumana Cave and mitigation measures, as warranted. We will provide your agency with a copy of the Revised Draft EA upon its completion.

Sincerely,

From: Fred D. Stone, Ph.D.
P.O. Box 1430
Kurtistown, HI 96760
Tel: 808-566-7251

Dear Mr. Chee,

I am enclosing my comments on the Draft EA for Connections Charter School in Kaumana. The intent of creating a “green” and environmentally sound plan for the new school is commendable. However, I was astonished to find that the major and important cave that underlies the upper property, Kaumana Cave, was left out of the draft EA. It is certainly impossible to carry out the plan without seriously impacting the cave, which does not fit the stated intention. There is no way to have a “green” and environmentally sound plan while ignoring a major and integral feature of the property.

The current plan has a strong potential of causing significant and irreversible environmental impacts on the cave and its specially adapted ecosystem. To recommend a Finding of No Significant Impact while ignoring a major part of the environment is simply untenable. I believe it is necessary to recommend an Environmental Impact Statement be carried out.

Please feel free to contact me if you have questions about my comments. I look forward to seeing your Final EA.

Sincerely,

Kukuihau HI 96760
Phone 808-966-7561
Sept. 2, 2009

SUMMARY

I am requesting that an Environmental Impact Statement be completed on the plan for Connections Charter School in Kaumana. The reasons are:

1. The Draft E.A. does not adequately assess the potential significant impact of the proposed development on Kaumana Cave, which underlies a major part of the project area beneath the former TMK 2-5-66-4, the mauna lot currently combined with TMK 2-5-06-141 (see Figures 1, 2, 3 below). Hawaiian land law includes property ownership not only the surface but the subsurface, including caves. It is therefore highly improper to leave out of the Draft E.A. a large and well-known cave that underlies, and is part of the proposed parcel.

2. The survey showing the location of Kaumana Cave under the development was omitted from the Draft E.A. This is a significant omission, given that the cave was surveyed by Island Survey as part of the Puuikono Extension EIS (1993, p.64). Although the Draft E.A. sites the Puuikono Extension EIS, the map showing the cave location was inexplicably left out. An accurate map of the cave is crucial for designing surface structures to avoid safety issues during construction and to prevent damage or pollution to the cave. (see Figure 1 below)

3. The Draft E.A. does not include the relevant parts of the Hawaii State Cave Protection Law (SH2898), which should be included in the Final E.A. and EIS.

4. Hazards relating to construction over Kaumana Cave have not been adequately addressed: the depth of the cave and the thickness of lava overlaying the cave have not been adequately measured, with related stability and safety issues for surface development and for roof collapse within the cave. Clearing and grading over the cave could also have significant impacts on the cave ecosystem and hydrology.

5. The issues regarding the placement of the school on an area with recent lava flows has not been adequately addressed: the entire development is on the 128 year old 1880-81 lava flow in the Mauna Kea/Mauna Loa saddle zone, that regularly channels lava flows from Mauna Loa’s upper northeastern rift zone.

6. The hydrology of the area is inadequately analyzed. A thorough hydrological survey needs to be included in the Final E.A. and EIS, as was done for the Puuikono Extension EIS (Appendix F, Drainage). The 1840-81 lava flow followed an intermittent stream channel from above Kaumana Village to below the planned development. The entire length of Kaumana Cave beneath the development is a floodwater channel on a perched aquifer. Runoff water from Kaumana Drive is channeled into the cave, and contributes to major flooding of the cave downdip.

7. Alternative sites are not adequately addressed, except to state that there aren’t any.

Given the serious potential environmental impacts of the development, other sites should be presented and reasons for their acceptance or rejection should be detailed.

8. The cave biology was not included in the Draft E.A. (Appendix B), although it has been thoroughly studied and is well known (Puuikono EIS, Appendix D).

Detailed Comments

Kaumana Cave is an important feature with many values that deserve to be protected. These include its natural resources (geology, vulcanology, geology, biology, microbiology) and its uses for education, tourism, recreation, religion and aesthetics. Over 2300 feet of Kaumana Cave lies within TMK 2-5-06-4, directly beneath the proposed Connections Charter School. However, the Draft E.A. for the planned school development contains no detailed assessment of the potential hazards of building the school over the cave, or the possible significant impacts of school construction on the cave and its resources. For this reason, It is essential that an Environmental Impact Study be conducted that will include an assessment of potential significant environmental impacts Kaumana Cave and its relation to the planned development.

1. Lack of a survey of Kaumana Cave is a serious fault of the Draft E.A. The location of the cave was clearly known to the planners who wrote the Draft E.A. as shown by their statement: Draft E.A. p. 10: “Just west of the property, on the far side of Kaumana Drive, is the main entrance to the Kaumana lava tube complex, which has been designated as Kaumana Caves County Park.”

Draft E.A. p. 29: “Portions of the project site are underlain by lava tubes that make up Kaumana Cave system. The entrance to Kaumana Caves is located at a small county park near the western-most tip of the property, across Kaumana Drive (Haile szczek-Hyndman, 1996).”

Since the planners knew that Kaumana Cave existed within the project site, it is imperative that they include the cave location in the plan with an assessment of potential impacts. A map showing the cave location was included in the 1993 Puuikono Street Extension EIS, copied here as Figure 1. Comparison of this with the planned Charter School shows that most of the school building, roads and septic systems were placed over or close to Kaumana Cave. Figure 2 shows the school plan from the Draft E.A. with red arrows showing the approximate location of the cave.

The necessity for the planner to include an accurate survey of the cave should be quite evident.
2. Hawaii Cave Protection Act, SB2868. In 2003 the State Legislature passed a Cave Protection Act to prevent damage to caves from vandalism and developments such as the planned Connections Charter School. It is critical that the planner include the Cave Protection Act in the Final EA and Environmental Impact Study, specifically including, in the design, a discussion of how potential significant impacts to the cave and its resources will be avoided or mitigated. Mitigation should include: no grading of the lava surface over the cave, no construction over the cave, prevention of sewage or other pollutants (such as pesticides) from entering the cave from septic drainage fields and code mandated pest control, avoiding cutting native trees or other vegetation over the cave to prevent loss of the major tree root food source for the cave ecosystem. The Cave Protection Act also requires that landowners give written consent to people entering caves under their land. The Draft EA does not include an analysis of how this would be accomplished, or whether the State as the Owner or the Lessee would be responsible for giving written permission to visitors to Kaumana Cave.

3. Hazards of construction over the lava tube roof. The draft EA states, p 29: "The lava tubes were formed in the core of the lava flow that covered the area in 1881-1882 with the roofs of the tubes being 20 to 25 feet thick in most places (McDonald et al, 1983)." This statement is usually inadequate as a guideline for avoiding hazards to construction equipment working over the cave, and as a protection from damage to the cave from roof collapses and from removal of the native 'ohi'a trees over the cave. The 1880-81 Kaumana lava flow occurred over a period of a few months. There was not time either for the cave roof to be thickened and strengthened by surface flows, or for the lava flow to erode deeply into the subsurface. It is more likely that the surface over the cave is not much more than 5 to 10 feet thick. However, the only way to determine the roof thickness is to conduct a survey through the cave, measuring the floor and ceiling elevations, and then over the surface above the cave to measure the surface elevation. Without this critical information, it is dangerous and impossible to permit construction over the cave. The vertical measurements should be done by professional surveyors as part of an Environmental Impact Study.

A possible mitigation measure is shown in Figure 3 showing approximate 100 foot safety borders that could be used to prevent significant environmental impacts to the cave and hazards to construction equipment. This design would exempt the area over and adjacent to the cave from any alteration, and place the school buildings, roads, septic systems, etc. on the outer portions of the lot.

A more desirable alternative would be to remove the entire makua parcel (the former TMK 2-5-06-4) from any development, and restrict the project to the makai parcel (the original TMK 2-5-06-141).
overflow during rain storm events South Hilo district is particularly impacted by this problem due to high amounts of rainfall. The Federal Emergency Management Agency (FEMA) has classified the lands within the project site as Zone X, lands with no recognized flood potential that are located outside both the 100-year and 500-year floodplain (Figure 3-2)."

Based on this, the draft EA states that the project area is not in a flood zone. This ignores the actual situation, that Kaumana Lava Flow followed an intermittent stream bed from above Kaumana Village to below the proposed development. This makes Kaumana Cave an underground flood channel. Figure 4 below shows the FEMA flood map with the approximate course of Kaumana Cave shown as red dashed arrows. During extended or heavy rainfall, which occurs several times each year, water runs into Kaumana Cave from intermittent streams and from a runoff channel that diverts Kaumana Road drainage into the cave in Kaumana Village. Water partially floods the cave, and some of this flood water exits from the Edita Street entrance, and floods the area downstream, including the lower TMK (2-5-06-141). Placing buildings, roads, parking areas, and septic drainage systems over this flood channel has a major potential for significant environmental impact.

The reason for this flooding is that the 1880-81 lava flowed over older soil layers that had formed incipient stream channels, and an actual stream bed that the lava tube followed. The stream still exists beneath the lava tube, and rises to partially fill it during flood periods.

It is important that, rather than citing a FEMA flood map that ignores the underground drainage, a hydrological study be done as part of an EIS, to determine the actual flood hazards. Interviews with residents below the Edita Street exit of Kaumana Cave will show that the cave has flooded that area several times in the past few decades.

The 1993 Pauinako Extension EIS, Appendix F, Drainage gives a detailed hydrological analysis of the area which should be used as the basis for the flood hazard assessment in the Final EA and EIS.

4. The draft EA cites the USGS Lava Flow Hazard Map: "...much of South Hilo, including the entire project site, is contained in Lava Flow Hazard Zone 3 which are areas that have had 15-75% of their surface covered by lava in the last 750 years, and 1-5% of their surface covered by lava since 1800."

Although this is technically a correct citation from the Lava Flow Hazard Map, it ignores the actual lava flow geology of the planned site. Rather than "...1-5% of [the] surface covered by lava since 1800", the proposed site has 100% of its surface covered by lava since 1881, 128 years ago. It is located in the Mauna Kea/Mauna Loa Saddle, which is the path followed by numerous lava flows from Mauna Loa. Additional historic lava flows that followed this pathway (with distance from the flow to the proposed development) include: 1852 (6 miles), 1855 (3 miles), 1942 (6 miles), 1984 (7 miles). (Wolfe & Morris, 1996. Geologic Map of the Island of Hawaii).

It would make more sense in terms of project design to use the actual flow lava activity in an assessment of lava hazards for the area, rather than the broad generalization given in the USGS Lava Hazard Map.

5. The draft EA quotes the FEMA flood potential map as follows (p32): "The island is geologically young and has not had a chance for the formation of defined watercourses in many areas. Those poorly defined watercourses often flow and
7. Biology of Kaumana Cave. Kaumana Cave was not included in the invertebrate survey for the proposed development area (Draft EA, Appendix B) even though it was included in the Puunukoko Extension EIS (Appendix D) which was available to the consultants. This is a serious omission, since a major part of the cave lies directly beneath the project area, and therefore should not have been excluded. Since the cave species depend directly on roots of ‘ohi’a trees (*Metrosideros polymorpha*), any activities over the cave that remove the ‘ohi’a trees will remove one of the major food sources for cave species, which has the potential of causing significant impact. The survey of Kaumana Cave species in 1992 for the Puunukoko Extension EIS showed several species that were excluded from the draft EA. These species are endemic to lava tubes on Hawai‘i Island, meaning they evolved on this Island and are found nowhere else on earth. The Final EA and EIS should include a current inventory of this important ecosystem. (Stone, F.D. et al. Lava tube tree communities. Culver & White. Encyclopedia of Caves.)

Some of the species left out of the draft EA include:
- Orthoptera: two cave adapted species: *Cacconemobius varius, C. uaku*
- Hemiptera: cave adapted plant hoppers: *Olius polyphemus*
- Hemiptera: cave water strider: *Sperrellia aau*
- Lepidoptera: cave entrance and deep cave moth: *Schrankia sp.*
- Millipede: cave adapted species: *Namulene*

Microbiology: Bacterial and fungal mats occur on the walls of Kaumana Cave, and are termed "cave slime". A group of cave microbiologists is currently including Kaumana Cave in an ongoing study of cave microorganisms. Most of the species haven't yet been described, and have potential medical uses. This study is partly supported by NASA to determine how organisms might exist in lava tubes on Mars. (Garica, M. et al. 1990)

6. Alternate sites. It is not adequate to simply state that no other sites exist. Given the hazards to construction on the proposed site, other sites should be identified and assessed. A more thorough assessment of other potential sites needs to be included in the final EA and in an EIS.
Figure 5: An endemic Hawaiian cave adapted cricket, *Caeconema fitzkerrii*, occurring in Kauanana Cave; showing tree root habitat. (Photo by Frank Howarth, Kauanana Cave, Hawaii)

8. Other uses for the project area. Kauanana Cave is an important natural resource with several important uses. These should be included in a thorough EIS assessment, which includes Kauanana Cave as an integral part of the lavaflow that overruns it. Currently, only the County Park around the cave entrance is protected. DLNR should give serious consideration to alternative land management that would protect the cave resources.

Scientific values: A great value of Kauanana Cave is that it occurs in Hilo and has easy access for scientific research. This allows scientists to use the cave as a field laboratory. Over the past several years, I have participated in research on cave crickets, cave plant-hoppers, and cave microbiology. Currently, Kauanana Cave crickets are being used in a Moore Foundation grant to UH Hilo on use of bar-coding to characterize Hawaiian species. Dozens of scientists who attended national and international meetings in Hilo have gone on field trips to Kauanana Cave. Meetings included the Evolution Society, the International Orthopterists Society, and the Wildlife Society.

Education: Kauanana Cave is ideally situated to use for class field trips, youth groups, and club outings. Since I began teaching at UH Hilo and Hawai‘i Community College in the mid-1980's, I have taken several classes to the cave each year with 15 to 20 students per class. Although I am now retired, I still conduct field trips for college classes. The total number of students I have taken to the cave over the past 25 years numbers well over 1000.

Tourism and recreation: Thousands of tourists and local residents visit Kauanana Cave every year. Apart from Thurston Lava Tube in Hawaii: Volcanoes National Park, Kauanana is the only cave that is easily accessible for visits that is still in its natural state. When I moved to Hawai‘i in 1984, the cave was strewn with litter and the walls were covered with graffiti. I enlisted my students and youth groups to help in picking up trash and scrubbing graffiti from the cave walls. Other cavers and community residents worked to clean a large accumulation of trash from the entrance on Kilauea Street in Kauanana Village. This trash had been washing throughout the cave during flooding. As a result of the clean-ups, the cave is currently a desirable place for tourists, and is being visited regularly. At almost any time on any day, one or several cars are parked in the Kauanana parking lot, and people are viewing the cave entrances. A few people go deeper into the cave. This is an enormous value for tourism and as recreation for local residents. It should not be excluded from a thorough EIS of the project properties. Recreational cave explorers regularly visit and explore the far recesses of Kauanana Cave. Many of these cavers are members of the Hawaii Speleological Survey, a part of the National Speleological Society. Detailed cave surveys have been done by experienced cave mapmakers, and these are available for use in a detailed EIS.

Religious and spiritual uses: Although Kauanana Cave formed fairly recently, and does not contain Hawaiian burials or evidence of other use, it wrapped offerings are regularly left just inside the entrance. Some of these contain pieces of coral, and the coral bits can be found around the Kauanana entrances. This indicates that religious use of the cave is still important to some people. Apart from traditional uses, many people find spiritual values by entering the deep cave.

Historical use: Kauanana Cave has an interesting history. The flows were observed by many Hilo residents, and were reported in the Hilo newspapers. Observers even reported lava flowing through the tube below the Kauanana County Park entrance. The story of Princess Ruth Ke‘elikolani who came from Maui and spent a night chanting in front of the lava flow, after which the flow stopped in spite of the dire predictions of the volcanologists, is well known in Hilo. Early visitors to the cave chipped their names and dates into the glassy lava tube lining, and this is now part of the cave history. Electrical insulation attached to the cave wall indicates that at some past date, the cave had been wired for visitors. More recently, in the 1940's and '50's the cave was designated a fall out shelter. This history, although recent, deserves to be included in an EIS.

Description of Kauanana Cave beneath TMK 2-5-06-4, makua of the Edits Street Entrance

This brief description is excerpted from the Puaikua Extension EIS, App. D. It should not be substituted for a thorough cave survey and inventory which should be included in a Final EA and EIS.

6.40 feet: 2.5 ft. high, 35-40 ft. wide. Contains large boulders washed through the cave and jammed against the roof.

49-450 feet: 4-8 ft. high, 10-30 ft. wide. Cave splits into two passages at 400 ft., for 50 ft.

450-800 feet: 4-8 ft. high, 10-20 ft. wide. Many 'ohia roots and cave species

800-925 feet: 4-6 ft. high, 45 ft. wide. The passage splits into two. Ceiling collapses occur at the two intersections.

925-1300 feet: 5-8 ft. high, 10-20 ft. wide. Abundant 'ohia roots and cave species occur throughout.

1300-1700 feet: 4-8 ft. high, 20-60 ft. wide. Passage splits into two, and at 1500 feet, both passages split again, making 4 passages until 1700 feet. From 1500 to 1700 feet there are massive ceiling collapses.

1700-2350 feet: 7-12 ft. high, 10-18 ft. wide. Abundant 'ohia roots and cave species. Occasional ceiling breakdowns.

RESOURCE INVENTORIES AND RESEARCH PROJECTS

Howarth, P.G., F.D. Stone, Nature Conservancy, 1992. Inventory of lava tubes and management recommendations for the Kiholo Bay area, State of Hawaii, State Parks,

RECENT GRANTS

Sept. 18, 2009

Dear Mr. Chee,

The Draft EA for Connections Charter School on p. 29 states: "The lava tubes were formed in the core of the lava flow that covered the area in 1881-1882 with the roofs of the tubes being 20 to 25 feet thick in most places (McDonald et al., 1983)."

I have been searching McDonald et al., 1983, Volcanoes in the Sea (as listed in the Draft EA references) to find the source of this citation. Unfortunately, the Draft EA omits the page of McDonald et al from which the statement is taken. I strongly urge you to include the exact reference in the Final EA, and to document it with scientific studies in an EIS.

In searching McDonald I have been unable to locate the "1881-1882" lava flow. Lava tubes are listed in McDonald on p. 25, 26, 27 and 29. Kaumana Cave in the 1881 flow is mentioned on p. 27. Table 3.1 on p. 64 lists the Mauna Loa flow that started on Nov. 1, 1880. On p. 179, Fig. 7.9 the 1881 flow is shown. Comparing this map with the Wolfe & Morris 1996 Geologic Map, the same flow is labeled the 1880-81 lava flow, and it is clearly the Kaumana flow. I do not believe McDonald et al made an error of one year for the Kaumana lava flow in their book.

Could the "20 to 25 feet thick" lava tube roof for the Kaumana lava flow, attributed to McDonald et al, also be a mistake? In the book, dates are used exclusively, so the reference to feet is clearly not taken directly from McDonald et al. The only reference I can find to a lava tube roof is on p. 27 (in the paragraph prior to the mention of Kaumana Cave). McDonald et al state: "Recently, a bulldozer clearing land on the slope of Kilauea volcano broke through the roof of a lava tube and dropped about 10 meters." This certainly does not give the impression of thick lava tube roofs that could be ignored in planning development over a lava tube. In fact, bulldozers breach lava tube roofs regularly on the Big Island. Recently, bulldozers clearing land over Kaumana lava tube for a Hawaiian Homes development just pushed Kaumana Village through the roof of the tube. Fortunately the bulldozer didn’t fall into the tube, and further development over the cave was stopped.

McDonald et al also discussed the 1881 lava flow on p. 170, in the chapter on Types of Eruption and Associated Hazards. "In 1881 a flow actually entered what is now Hilo, and only the end of the eruption prevented it from entering and eventually filling Hilo Harbor. The volume of the 1881 lava flow was about 182,000,000 cubic meters. If it had had a volume equal to that of the 1859 flow on the northwest slope of Mauna Loa—close to 450,000,000 cubic meters—there is little question that the harbor and the town would have been destroyed."

I sincerely hope that in the Final EA you will fully document, or correct, the statements attributed to McDonald et al.

In my initial comments, I included a description of Kaumana Cave beneath the proposed Charter School development, in order to give you a better idea of the actual size, potential collapse areas, and biological resources of the cave. I am now attaching a map showing the areas of concern.

Fred D. Stone, Ph.D.

Co. Laura Thielen, Chairperson, DLNR
John Thatcher, Director, Connections Charter School

Description of Kaumana Cave beneath TMK 2-5-66-4, mauna of the Edita Street Entrance

This brief description is excerpted from the Punaako Extension EIS, App. D. It should not be substituted for a thorough cave survey and inventory which should be included in a Final EA and EIS. (See Figure 6)

9-40 feet: 2.5 ft. high, 33-40 ft. wide. Contains large boulders washed through the cave and jammed against the roof.

40-450 feet: 4-8 ft. high, 10-30 ft. wide. Cave splits into two passages at 400 ft., for 50 ft.

450-800 feet: 5-8 ft. high, 10-20 ft. wide. Many ‘ohi’a roots and cave species

800-925 feet: 4-6 ft. high, 45 ft. wide. The passage splits into two. Ceiling collapses occur at the two intersections.

925-1300 feet: 5-8 ft. high, 10-20 ft. wide. Abundant ‘ohi’a roots and cave species occur throughout.

1300-1700 feet: 4-8 ft. high, 20-60 ft. wide. Passage splits into two, and at 1500 feet, both passages split again, making 4 passages until 1700 feet. From 1500 to 1700 there are massive ceiling collapses.

1700-1850 feet: 7-12 ft. high, 10-18 ft. wide. Abundant ‘ohi’a roots and cave species.

Occasional ceiling breakdown.

Subject: Draft Environmental Assessment for Connections Public Charter School Master Plan, South Hilo, Hawai‘i, TMK (3) 2-5-006:141

Dear Dr. Stone,

We have received your letters dated September 4 and September 18, 2009 concerning the Draft Environmental Assessment for the Connections Public Charter School (CPCS) Master Plan. Wil Chee - Planning & Environmental (WCP) and CPCS greatly appreciate the time and effort you committed to providing information regarding Kaumana Cave. A detailed discussion of Kaumana Cave and any impacts potentially resulting from the project was not omitted intentionally, and we are grateful for your efforts to make us aware of the cave system's sensitive nature.

One of the primary visions for the new campus is to develop the property in an environmentally friendly and responsible way, with particular effort to leave as much of the natural environment intact as possible. After further research and review, it was determined that reconfiguring the campus layout to avoid the cave and any potential conflicts was prudent. Development of major school facilities are now being proposed within the property's lower parcel, below Edita Street. While a small segment of Kaumana Cave may eventually be a portion of the lower parcel's northern corner, indications are that this portion of the cave was closed off when Edita Street was constructed in the 1950s, and is unlikely accessible. Due to safety concerns and to protect Kaumana Cave, the revised campus plan will maintain a minimum 100-foot buffer between any school facility and the cave. Enclosed for your information is a brief description and conceptual drawings of the reconfigured campus plan. If you have any comments or suggestions regarding the reconfigured plan, please convey them to WCP and Mr. John Thatcher, CEO of CPCS, by May 28, 2010.

CPCS and WCP are preparing a Revised Draft E,A for this project, which will address the reconfigured campus layout, any potential effects on Kaumana Cave and mitigation measures, as warranted.

Please find below our responses to your comments on the Draft EA for the Connections Public Charter School Master Plan.

Comment #1 - The current plan has a strong potential of causing significant and irreversible environmental impacts to the cove and its specially adapted ecosystem.

The campus plan has been changed to avoid any conflict with Kāāīmana Cave and to avoid significant adverse impacts. With the exception of the walkway, no development is being proposed for the upper portion of the property, under which the accessible segment of Kāāīmana Cave is located. A minimum 100-foot protective buffer surrounding the cave will be observed on both the upper and lower portions of the property.

Comment #2 - The survey showing the location of Kāāīmana Cave under the development was omitted from the Draft EA. This is a significant omission, given that the cave was surveyed by Island Survey as part of the Puamakko Estention EIS (1993; p34).

Now that you and others have kindly provided us with copies of cave maps and references that document the cave's exact location, we will incorporate that information into the Revised Draft EA. With this new information, we have, as stated above, reconfigured the campus plan to avoid impacting Kāāīmana Cave.

Comment #3 - The Draft EA does not include the relevant parts of the Hawaii State Cave Protection Law (SH 289), which should be included in the Final EA and EIS.

A section of the Revised Draft EA will include a discussion of the Hawaii Cave Protection Law, first passed in 2002, then amended in 2008 as HRS § 4D.

Comment #4 - Hazards relating to construction over Kāāīmana Cave have not been addressed adequately: the depth of the cave and the thickness of lava overlying the cave have not been adequately measured, with related liability and safety issues for surface development and for roof collapse within the cave. Clearing and grading over the cave could also have significant impacts on the cave's ecosystem and hydrology.

The reconfigured campus plan no longer proposes development over any portion of Kāāīmana Cave, thereby eliminating the risk of complications related to cave depth and roof thickness. Nonetheless, available documentation will be reviewed and the thickness of the lava overlying the cave and the depth of the cave will be discussed in the Revised Draft EA. Development of major campus facilities will be limited to the lower parcel, maintaining a minimum 100-foot buffer between any school facility and the cave. No clearing or grading will occur over the cave.

Comment #5 - The issues regarding the placement of the school on an area with recent lava flow has not been adequately addressed: the entire development is on the 128 year old 1880-1881 lava flow in the Mauna Kea/Mauna Loa Saddle zone, that regularly channels lava flows from Mauna Loa's upper northeast rift zone.

The volcanic hazards section in the Revised Draft EA will be expanded to include a more thorough discussion of the proposed action's risk to exposure from volcanic hazards.

Comment #6 - The hydrology of the area is inadequately analyzed. A thorough hydrological survey needs to be included in the Final EA and EIS, as was done for the Puamakko Estention EIS (Appendix P, Drainage). The 1860-1881 lava flow followed an intermittent stream channel from above Kāāīmana Village to below the planned development. The entire length of Kāāīmana Cave beneath the development is a flood water channel on a perched aquifer. Runoff water from Kāāīmana Drive is channeled into the cave, and contributes to major flooding of the cave down slope.

The discussion of hydrology and groundwater resources will be expanded in the Revised Draft EA. How Kāāīmana Cave functions within the hydrologic cycle at the project site will be included in the hydrology discussion as well.

The project would not increase the occurrence or severity of flooding from water discharge events from Kāāīmana Cave. Unfortunately however, a drainage problem does already exist on Edita Street. The Revised Draft EA will discuss the problem of runoff channeled into the cave at higher elevations along Kāāīmana Drive and how it impacts the drainage on Edita Street. However, solving the problem of flooding of Kāāīmana Cave and the periodic overflow onto Edita Street is beyond the scope of the project. This is a watershed-wide issue that should be addressed by the responsible government agencies (e.g., County of Hawaii Department of Public Works).

Please note that at this stage of the planning process only conceptual plans are being prepared. The EA, which addresses the campus master plan, is needed to secure the land lease from the State of Hawaii. Once the lease is obtained and further funding becomes available, the school can conduct additional studies, as needed, to prepare more detailed architectural and engineering plans during the design development phase. Such additional studies would include an engineering study of Hualalai's watershed that would address any outstanding drainage issues identified in the Revised Draft EA.

Comment #7 - Alternative sites are not adequately addressed, except to state that there aren't any. Given the serious potential environmental impacts of the development, other sites should be presented and reasons for their acceptance or rejection should be detailed.

The campus has been reconfigured to avoid significant adverse environmental impacts. The discussion pertaining to why alternative sites were rejected will be expanded in the Revised Draft EA.

Comment #8 - The cave biology was not included in the Draft EA (Appendix B), although it has been thoroughly studied and is well known (Puamakko EIS, Appendix D).
Discussion of flora and fauna will be expanded in the Revised Draft EA to include cave biology.

Comment #9 - Alternative uses of Kālūkūlu Cave and the State land overlying it have not been adequately assessed:
- Science: geology, volcanology, biology, microbiology
- Tourism, recreation
- Education
- Religious and spiritual use
- Historic values

The intent of the environmental assessment is not to discuss alternative uses for Kālūkūlu Cave, but to determine the possible environmental impacts resulting from the proposed campus master plan. Exploring alternative uses for this site is beyond the scope of this project and environmental assessment. However, the Revised Draft EA will expand the relevant discussions to address potential impacts to these resources and activities as they relate to Kālūkūlu Cave.

As you know, the entrance to Kālūkūlu Cave is from a county park, located across Kālūkūlu Drive. However, the portion of the cave underlying the subject property is under the jurisdiction of the State Department of Land and Natural Resources (DLNR). If CPCPS is successful in obtaining a lease from the state, access to the portion Kālūkūlu Cave that is located within the boundaries of the leased land would still need to be approved by DLNR, and possibly the Land Board. It is our understanding that DLNR would consult with CPCPS on all requests for entry to the cave to ensure that the activities for which the request is being made, does not interfere with the school’s programs.

If you have questions with the use and access to Kālūkūlu Cave, possibly you and others could be the driving force behind the formation of a non-profit organization to manage the cave resources and provide educational interpretation of the lava tube geology, ecology, religious, spiritual and historic values to residents and visitors. You may wish to consider working with DLNR to proactively manage the cave, as well as with CPCPS to incorporate management activities as part of their educational program.

Comment #10 - The Draft EA for Connections includes a citation from McDonald, 1983 regarding the depth of Kālūkūlu Cave. In searching McDonald 1983 the reference was unable to be verified.

Thank you for pointing out the citation error. The discussion references a description of the lava tube contained in Roadside Geology of Hawaii (Hazlett & Hyndman, 1990). Much of Hazlett & Hyndman’s information on the lava tube was sourced from Adams & von Seggern, 1969, Electronic Mapping of Hawaiian Lava Tubes. The source material will be reviewed and the discussion and citation corrected, as needed, in the Revised Draft EA.

Comment #11 - Unable to locate information about an 1881-1882 lava flow, no information linked to such dates in Macdonald. Could the preparer have made a mistake?

The dates of 1881-1882 were from Hazlett & Hyndman (1990). We will review the available documentation on Kālūkūlu Cave and revise the discussion as needed.

Comment #12 - The only reference to the thickness of the lava tube roof in McDonald states that a bulldozer clearing land for a development broke through the roof of the cave and dropped 10 feet. This does not give the impression of a thick lava roof, etc.

The citation regarding the thickness of the lava tube roof should have been attributed to Hazlett & Hyndman (1990), in which it is stated that in most places, the roof of Kālūkūlu Cave ranges from 20 feet to 25 feet. The available literature on Kālūkūlu Cave will be reviewed again and the relevant sections of the Revised Draft EA will be corrected and clarified, as needed.

We greatly appreciate the time and effort you put forth in your comments to the draft EA for this project. Your comments and contributions will help us to produce a better document. Again, if you have any suggestions on the enclosed reconfigured campus master plan, please let me know by May 28, 2010. I can be contacted by mail, email, or telephone.

Honolulu, Hawaii 96814-1929

Dear Mr. Chee,

It has been brought to my attention that there is an application to create a school on property adjacent to, and partly overlying, the Kaumana Cave system, a notable lava tube complex in which I and my scientific colleagues have been conducting research. The prospect of construction close to this geologically and biologically significant feature is of great concern to us for a series of reasons: 1) the scientific value of this site as we are revealing it through our research, 2) the danger to structures that are built above cavities, 3) the potential precedent that such a situation would create, contrary to my federal Institute's efforts to alert the public that human structures should not be built above ANY type of cavity, whether in a lava tube or some other rock type common elsewhere in the United States, and 4) Kaumana Cave represents the natural wealth that is the rightful heritage of the Hawaiian people and this treasure should be protected for them and the rest of our species to appreciate and potentially use. Briefly, I will address these in order.

1) The scientific research we are conducting, in my capacity as professor and scientist at New Mexico Institute of Mining and Technology, centers around the unique microorganisms that are growing on the walls of this cave. I have enclosed an image of one example of these organisms courtesy of Dr. Kevin Ingham, the cave photographer who works on our team. These organisms are spectacularly beautiful, even at the naked eye scale, but more importantly they are adapted to the extreme cavity conditions. Many of the lava tubes are species of science as is being revealed by my colleague, Dr. Diana Nanthin at the University of New Mexico. These tiny creatures can use a large number of unusual materials, possibly even materials within the basalt, to make their living. I am investigating how they perform these chemical transformations and the compounds they produce as a byproduct. The microbial communities represent a wealth of potential significance of compounds that can be of enormous future value to medicine and industry. Different colonies have different appearances. The pink patches shown in the accompanying image produce an unusual pink water soluble pigment, yellow patches produce a yellow pigment, and thin colonies produces an orange pigment. In preliminary trials, I have found that these pigments appear to inhibit the activity of surrounding bacteria, indicating that they are probably antibiotics. The unique minerals that are being produced by these organisms are another area of vigorous research by our mineralogist colleague Michael Spilde, Manager of the Scanning Electron Microscopy and Electron Microprobe Laboratories at the University of New Mexico.

2) Cavities are well known potential geohazards subject to shifting or collapse. This is as true of lava tubes as it is of limestone caves or other subsurface cavities. Such a situation can present near-term and long-term hazards to construction. Microfractures and larger cracks that occur, even as the original system cools, gradually shift and weather over time and structural soundness is notoriously difficult to assess in such conditions. Secondly, human activities produce fluid byproducts, e.g. grey water, sewage, landscaping run-off, that can infiltrate through fractures and enter the cavities below. These can present a potential human health hazard and repository for fecal coliforms and other disease agents. In addition, they present a direct danger to native microorganisms that can be out-competed for nutrients by these contaminant microbes from the surface. And obviously, such contamination is also a threat to larger animals including invertebrates of all types that may inhabit the tube system.

3) The National Cave and Karst Research Institute, of which I am Associate Director for Academics, is a federally mandated and supported institution devoted to educating the public, planners, and other stakeholders about issues to do with caves, karst landforms, associated water quality issues, and pollution and remediation issues in these types of environments. We are trying to get out the message that building above cavities is a very unsafe policy, whether those cavities are lava tubes in Hawaii or limestone or gypsum caves elsewhere. Sinkhole or tube collapse and pollution of subsurface environments, are all issues that have arisen when inappropriate siting decisions are made for residential, commercial, industrial, and other private uses. These poor decisions and their resulting consequences can extensively damage or destroy property and put human lives at risk. We are available to inform and advise to any that seek guidance from our technical expertise and resources in helping stakeholders make better decisions about living with cave and karst resources.

4) Hawaii is a unique place, as is well appreciated by those who live there, as well as those of us privileged to conduct research and visit the islands from time to time. The special relationship of the landscape to the native Hawaiian population, and those that have come after, cannot be over-emphasized. The lava tubes and their biological, mineralogical, and human cultural contents are a magnificent and unique part of that natural heritage. It is an ethical obligation and a wise practical policy to protect those resources from any unnecessary damage or other compromise.

I urge you to consider these vital issues as you go forth with the process of siting the school to other, more suitable locations. Please let us know, if we can assist you in any way.

Sincerely,

Subject: Draft Environmental Assessment for Connections Public Charter School Master Plan, South Hilo, Hawai‘i, TMK (3) 2-5-006:141

Dear Dr. Boston,

Thank you for your comments dated September 6, 2009 concerning the Draft Environmental Assessment for Connections Public Charter School (CPCS) Master Plan. WCP Chee - Planning & Environmental (WCP) and CPCS greatly appreciate the time and effort you committed to providing information regarding Ka‘imana Cave. A detailed discussion of Ka‘imana Cave and any impacts potentially resulting from the project was not omitted intentionally, and we are grateful for your efforts to make us aware of the cave system’s sensitive nature.

One of the primary visions for the new campus design is to develop the property in an environmentally friendly and responsible way, with particular effort to leave as much of the natural environment intact as possible. After further research and review, it was determined that reconfiguring the campus layout to avoid the cave and any potential conflicts was prudent. Development of major school facilities are now being proposed within the property’s lower parcel, below Edita Street. While a small segment of Ka‘imana Cave may underlie a portion of the lower parcel’s northern corner, indications are that this segment of the cave was closed off when Edita Street was constructed in the 1950s, and is likely inaccessible. Due to safety concerns and to protect Ka‘imana Cave, the revised campus plan will maintain a minimum 100-foot buffer between any school facility and the cave. Enclosed for your information is a brief description and conceptual drawings of the reconfigured campus plan.

CPCS and WCP are preparing a Revised Draft EA for this project, which will address the reconfigured campus layout, any potential effects on Ka‘imana Cave and mitigation measures, as warranted.

In response to your comments on the Draft EA, we offer the following:

Comment #1 – The scientific value of this site is important and invaluable.

The revised campus master plan no longer proposes to build any structures on top of Kualima Cave. A minimum 100-foot protective buffer surrounding the cave will be observed on the both the upper and lower portions of the property. The buffer should be adequate to protect the cave’s ecological system and the organisms that have adapted to the lava tube’s uniquely specialized environment. Part of PUC’s vision is to establish an environmentally-sensitive center for education, and the school would not deliberately diminish the educational opportunities for others.

Comment #2 – It is dangerous to build on top of caves and other cavities. This action would create a precedent, which has the potential to expose other development projects to the dangerous risks of developing over caves and cavities.

There will no longer be any structures overlying any part of Kualima Cave. The 100-foot protective buffer should allay concerns regarding the structural integrity of the cave and the potential risks associated with developing over the caves.

Comment #3 – Kualima Cave is a precious part of native Hawaiian heritage and should be protected.

Kualima Cave was formed during the 1881 Mauna Loa flow. Given its relatively recent origins, the cave is unlikely to contain human burials or native Hawaiian historic/cultural material. However, there are known historic elements within the cave, such as petroglyphs and electrical insulators attached to the cave wall. Because these elements date back more than 50 years, they do impart historic significance to the cave. We are conducting ongoing consultation with the State Historic Preservation Division to ensure that any historic and cultural resources would not be adversely affected by the project. Further, changes that have been made to campus plan should ensure that Kualima Cave will be protected.

We appreciate the time and effort you put forth in your comments on the draft. Thank you for participating in the environmental review process with us.

Sincerely,

Celia Suen
Planner

cc: John L. Thatcher, CEO Connections Public Charter School

Enclosure
In order to responsibly manage the surface and groundwater hydrology associated with Kaumana Cave, a hydrologic study needs to be conducted to delineate the groundwater recharge area, identify underground flow routes, and to confirm points of discharge both during base level and storm flow conditions.

Section 3.1.4: Biological Resources

Though a biological survey of surface flora and fauna was conducted for the purpose of the DEA, there is no mention of the cave fauna of Kaumana Cave. This is a serious omission considering that these species exist ONLY in lava tubes on Hawaii Island. A cave fauna survey was conducted in association with the DEA for the Puakea Stream Project and no information is available. Construction associated with development and land use activities that compromise the 'ohi'a trees above the cave system will have detrimental effects on the cave ecology since there are a major food source for the treefauna species that live in the cave. Contaminant transport into the cave also poses a serious threat to its unique and significant underground ecosystem. The effects of development and land use on the underground ecosystem should be included in an environmental impact study.

The intent of the EA was "to ensure that comprehensive and systematic consideration is given to potential impacts of the proposed action upon the natural and man-made environment." (Draft EA p. 7). However, omission of a map that shows the location and extent of the cave, along with an accurate assessment of the cave's relationship to surface topography, nor any assessment of the groundwater hydrology, or the cave's natural resources, indicates that comprehensive and systematic consideration has NOT been given to the impact of construction and development. These omissions not only potentially compromise Kaumana Cave System but also run contrary to the project's vision of "constructing a green school which would become a model of sustainable development and design" (Draft EA p. 13).

Kaumana Cave System is important for its natural, historical, and cultural resources. It is currently used for educational and research purposes, and is a popular tourist and recreational site. Any development in the area should address impacts within each of these contexts and as such a full environmental impact study is critically important.

If you have any questions about my comments, please don't hesitate to contact me.

Sincerely,

Patricia Kambea

Subject: Draft Environmental Assessment for Connections Public Charter School Master Plan, South Hilo, Hawaii, TMK (J) 2-5-606:141

Dear Ms. Kambea,

Thank you for your comments dated September 6, 2009 concerning the Draft Environmental Assessment for the Connections Public Charter School (CPCS) Master Plan. Wil Chee - Planning & Environmental (WCP) and CPCS greatly appreciate the time and effort you committed to providing information regarding Kaumana Cave.

One of the primary visions for the new campus is to develop the property in an environmentally friendly and responsible way, with particular effort to leave as much of the natural environment intact as possible. After further research and review, it was determined that reconfiguring the campus layout to avoid the cave and any potential conflicts was prudent. Development of major school facilities are now being proposed within the property’s lower parcel, below Edna Street. While a small segment of Kaumana Cave may underlie a portion of the lower parcel’s northern corner, indications are that this portion of the cave was closed off when Edna Street was constructed in the 1950s, and is likely inaccessible. Due to safety concerns and to protect Kaumana Cave, the revised campus plan will maintain a minimum 100-foot buffer between any school facility and the cave. Enclosed for your information is a brief description and conceptual drawings of the reconfigured campus plan.

CPCS and WCP are preparing a Revised Draft EA for this project, which will address the modified campus layout, any potential effects on Kaumana Cave and mitigation measures, as warranted.

In response to your comments on the Draft EA, we offer the following:

Comment #1 — The location of Kaimana Cave and a discussion of the environmental impacts to the cave from the development has not been addressed in the DEA.

Discussion of environmental impacts on Kaimana Cave was not intentionally omitted, and we are grateful for your efforts to make us aware of the cave system's sensitive nature. The revised campus master plan no longer proposes to construct structures over any part of Kaimana Cave. A minimum 100-foot protective buffer surrounding the cave will be observed on both the upper and lower portions of the parcel to protect the cave system and to prevent risk of injury from collapse. The new campus master plan should ease concerns regarding impacts to the cave; however if any effects to Kaimana Cave are anticipated to result from the revised campus plan, they will be discussed in the Revised Draft EA.

Comment #2 — The cited thickness of the cave is in question, and speleological surveys have been conducted documenting the thickness to be 5 to 10 feet.

We acknowledge your point that the Draft EA inaccurately discusses the roof thickness of the segment of Kaimana Cave that traverses the subject property and we will correct this information in the Revised Draft EA. As part of CPCSS’s vision to create an environmentally sustainable and responsible campus, the master plan for the school has been modified to avoid impacting the cave. Structures are no longer proposed to override any part of Kaimana Cave and a minimum 100-foot buffer surrounding the cave will be observed in which no clearing or grading will occur. This buffer should be adequate to protect the cave roof from accidental collapse.

Comment #3 — There is no mention of groundwater hydrology in section 3.1.2. A hydrologic study needs to be conducted to understand groundwater hydrology.

The discussion of hydrology and groundwater resources has been expanded in the Revised Draft EA. How Kaimana Cave functions within the hydrologic cycle at the project site is now included in the hydrology discussion as well. However, we believe that a hydrological study of the scope you indicate is not warranted for this project. While a watershed-wide hydrological study would be beneficial to better understand flooding conditions and to develop long-term flood prevention and protection measures throughout the watershed, CPCSS should not bear that responsibility. A study of that magnitude should involve other stakeholders, such as the County of Hawaii Department of Public Works, as was done for the Waihuku-Alemanio Watershed.

The project would not increase the occurrence or severity of flooding from water discharge events from Kaimana Cave. Unfortunately, however, a drainage problem does already exist on Edita Street. The Revised Draft EA will discuss the problem of runoff channeled into the cave at higher elevations along Kaimana Drive and how it impacts the drainage on Edita Street.

Please note that at this stage of the planning process only conceptual plans are being prepared. The EA addresses the campus master plan, which is needed to secure the land lease from the State of Hawaii. Once the lease is obtained and further funding becomes available, additional studies can be conducted as needed, to prepare more detailed architectural and engineering plans during the design development phase. Such additional studies would include investigating storm water runoff and drainage in order to develop adequate drainage plans to mitigate any flood hazards posed by Edita Street on the subject property.

Comment #4 — A discussion of the flora and fauna of Kaimana Cave was omitted from the section discussing biologic resources. Disrupting the ohia trees will have a detrimental effect on the cave ecosystem.

A new section is being added to the Revised Draft EA which discusses features and attributes of Kaimana Cave, including biological resources. We acknowledge your point and concord that disturbing the ohia trees would have a detrimental effect on the ecosystem of Kaimana Cave. As stated above, the revised campus master plan will maintain a minimum 100-foot buffer surrounding the cave in which no grading or clearing would occur. While an elevated walkway is being proposed for the upper parcel, this too would be located beyond the 100-foot cave buffer. This walkway would be a lightweight structure that would require shallow footings and posts to support and minimal clearing of trees.

We appreciate the time and effort you put forth in your comments to the draft EA for this project. Thank you for participating in the environmental review process with us.

Sincerely,

Celia Shen

RE: Comments on 2005-08-09 EIA for Connections New Century Public Charter School of Kaumanu

To Whom It May Concern:

I am a research entomologist, who has been studying Hawaiian insects for nearly 40 years. My specialties include evolution and ecology of cave and montane-top fauna, as well as the impacts of invasive non-native species on Hawaii. I have been studying the ecology of Kaumanu Cave since 1971. My comments on the draft environmental assessment are based on my research and my personal views. They do not represent testimony from my employer, Bishop Museum. I hereby strongly recommend that a full environmental impact study be prepared for the Connections New Century Public Charter School of Kaumanu. The draft EA is not an adequate disclosure document. There are significant gaps in the draft regarding both risks to public safety and impacts on natural resources posed by the proposed development. Identification of these risks and impacts may be possible, but only if they are identified and addressed in a full disclosure document that includes public input. There is a precedent in 1991, an EIS was prepared for the Puleka'e tunnel and widening project. That EIS addressed many concerns that have been raised or outlined in the current draft EIA for the Connections New Century Public Charter School development. A critical concern is the discussion of environmental concerns posed by the relationship of Kaumanu Cave to the proposed project.

There are significant risks to the project posed by the potential for collapse of the cave roof during and subsequent to construction. A catastrophic roof collapse would represent serious safety and liability issues. The roof is much thinner than it is shown in the DEA as can be seen, for example, at the downslope end of the main county park entrance on Kaumanu Drive. An accurate map of Kaumanu Cave showing its relationship to the development should be included for planning and mitigation purposes. Even though the main risk of collapse would be associated with the lava tube, large cave-like voids may occur anywhere within the cavernous 1881 lava flow and may represent similar hazards.

The portion of Kaumanu Cave that lies beneath the project area contains significant natural resources, including geologic formations that are prime examples of volcanic processes and a unique underground ecosystem inhabited by blind obligate cave species, as well as critical, religious and aesthetic values. The cave is easily accessible and extensively used for education, scientific research, religious, spiritual renewal, recreation, and tourism. The cave and its resources fall under the Hawaii Cave Protection Law (2002) and, therefore, deserve to be included in the EIS.

The rich natural resources of the cave align with its unique aesthetic qualities have been featured in many films and TV documentaries including productions shown on NOVA, Discovery Channel, BBC Natural History Programs, Open University, the JASON Project and NATURE. [These films have not only elevated and entertained millions of viewers worldwide; they have also helped advertise Hawaii and its natural wonders to the tourism industry.] If Kaumanu Cave and its resources are seriously impacted, this use will end, denying the educational community of a valuable resource and the favorable international reputation given the Hawaiian natural environment.

Although surveys of the surface fauna and flora were included in the DEA, no mention is made of the significant subterranean fauna that lives in the cave. This is especially surprising since the entomologist conducting the surface survey should have known of the cave fauna. The omission is a serious issue that should be filled. We have over 25 years of data on the distribution, population trends and ecology for many of the species present within the cave.

Wilt Cline – Planning and Environmental

The discovery of a specialized cave fauna within the 90-year-old Kaumanu Cave in 1971 presented quite a shock to conventional wisdom on the origin of cave fauna (Howarth, 1971, SCIENCE 172:252). Surprisingly, four obligate cave species had already colonized the cave by 1971 - a mere 50 years after formation. Significantly, three additional obligate cave species have colonized the cave during the past two decades. They arrived by dispersing through underground cavities from neighboring flows. At least another five species are known from older caves on Easter Mau Loa and Kilauea and are expected to colonize the cave eventually. Two of the species in Kaumanu Cave have been listed as "species of concern" by the USFWS (Table 1). Kaumanu Lani Tube is currently the best site anywhere in the world to witness and study evolution and community development in cave ecosystems.

Adding to the cave's significance is the 78 years of historical data. More than 40 papers have been published that included results of biological studies conducted in the cave (see attached reference list). In addition, research that was part of at least four theses for advanced degrees was conducted in the cave. The foundation grants that funded many of these studies represent a significant infusion of education and science funding into the state's economy.

Breaching the cave through collapse, increases in pollution, changes in hydrology and destruction of the surface environment resulting from the development will seriously impact the biological and other resources within the cave, and likely end the scientific studies that are ongoing in the cave. The main food source supporting the underground community is ohia tree roots (Figure 1). Destruction of the vegetation and paving the surface as prepared will permanently damage the cave ecosystem and its specialized habitats. The effects of the proposed development along with mitigation procedures should be described in detail in an environmental impact study.

In conclusion, Kaumanu Cave System contains highly significant natural resources, which could be critically impacted by development or adjacent to the cave. A thorough environmental impact study is warranted.

Thank you for your attention.

Subject: Draft Environmental Assessment for Connections Public Charter School Master Plan, South Hilo, Hawai‘i, TMK (3) 2-5-006:141

Dear Dr. Howarth,

Thank you for your comments dated September 4, 2009 concerning the Draft Environmental Assessment for the Connections Public Charter School (CPCS) Master Plan. Wil Chee-Planning and Environmental (WCP) and CPCS greatly appreciate the time and effort you committed to providing information regarding Kālima Cave. A detailed discussion of Kālima Cave and any impacts potentially resulting from the project was not intended, and it is our sincere wish that you will find the bibliography of your publications over the years related to Kālima Cave. During preparation of the Draft EA, we did conduct a literature search for information on the Kālima cave and only found very generalized information. The sources you provide are very specialized and appear to be found primarily in professional or very specialized journals that are not readily available to the public.

One of the primary visions for the new campus is to develop the property in an environmentally friendly and responsible way, with particular effort to leave as much of the natural environment intact as possible. After further research and review, it was determined that reconfiguring the campus layout to avoid the cave and any potential conflicts was prudent. Development of major school facilities are now being proposed within the property's lower parcel, below Edina Street. While a small segment of Kālima Cave may underlie a portion of the lower parcel's northern corner, indications are that this segment of the cave was closed off when Edina Street was constructed in the 1950s, and is likely inaccessible. Due to safety concerns and to protect the Kālima Cave, the revised campus plan will maintain a minimum 100-foot buffer between any school facility and the cave. Enclosed for your information is a brief description and conceptual drawings of the reconfigured campus plan.

CPCS and WCP are preparing a Revised Draft EA for this project, which will address the reconfigured campus layout, any potential impacts on Kālima Cave and mitigation measures; as warranted.

Dr. Fred Howarth
May 7, 2010
Page 2

Please find below our responses to your comments on the Draft EA for the Connections Public Charter School Master Plan.

Comment #1 – Strong recommendation of a full environmental impact statement based on significant gaps in the discussion of environmental impacts and mitigation measures.

Given the changes that are being made to the campus master plan to avoid the Kālima Cave and associated impacts, we believe that a full environmental impact statement for the project is not warranted. As stated above, a Revised Draft EA that addresses the reconfigured campus plan, its potential effects, and mitigation measures, as warranted, will be issued and made available for public review.

Comment #2 – There are concerns with the thickness of the lava tube roof, and collapse poses a significant risk that needs to be addressed.

The revised campus master plan no longer proposes to build any structures on top of Kālima Cave. A minimum 100-foot protective buffer surrounding the cave will be observed on both the upper and lower portions of the property. No clearing, grading or construction work will be conducted within this 100-foot buffer. The buffer should be adequate to protect the cave roof from accidental collapse.

Comment #3 – The resources of Kālima Cave, the Hawai‘i Cave Protection Law, and impacts to the cave from the proposed development need to be discussed in the document.

A new section will be added to the Revised Draft EA, which discusses the unique resources of Kālima Cave and the Hawai‘i Cave Protection Law. With the revised campus plan, we do not anticipate any significant adverse impacts to Kālima Cave; however if any potential effects are identified, they will be discussed.

Comment #4 – A discussion of the flora and fauna of Kālima Cave was omitted from the section discussing biological resources of the site.

The flora and fauna discussion will be expanded in the Revised Draft EA to include the biological resources of Kālima Cave.

Comment #5 – Destruction of the ohia trees at the surface creates a significant negative impact to the cave ecosystem.

A new section is being added to the Revised Draft EA which discusses features and attributes of Kālima Cave, including its biological resources. We acknowledge your point and concern that disturbing the ohia trees would have a detrimental effect on the ecosystem of Kālima Cave. As stated above, the revised campus master plan will maintain a minimum 100-foot buffer surrounding the cave in which no grading or clearing would occur. While an elevated walkway is being proposed for the upper parcel, this too would be located beyond the 100-foot cave buffer. This walkway would be a lightweight structure that would require shallow footings and posts for support and minimal clearing of trees.
We appreciate the time and effort you put forth in your comments to the draft EA for this project. Thank you for participating in the environmental review process with us.

Sincerely,

Celia Shen, Planner

September 5, 2009

Wil Chee—Planning and Environmental
Celia Shen / Richard Stook
1018 Palm Drive
Hilo, HI 96714

Aloha,

Moku Loa Group of the Sierra Club Hawaii Chapter represents a membership of over 1,000 residents of Hawaii Island. Our review of the Draft Environmental Assessment for the Connections New Century Public Charter School, proposed for TMK (3) 2-5-003:141 leads us to find that there are significant potential environmental impacts not disclosed in this study.

The stated purpose of the EA is to ensure that comprehensive and systematic consideration is given to potential impacts of the proposed action on the natural environment. While 1.5 Determination states the effects will not have a significant adverse effect on the environment, we do not believe that all potential impacts have been described or evaluated. A Finding of No Significant Impact should not be recommended for this project, and a full EIS is requested.

Kaumana Cave is a treasure, both for its scientific value, and for the recreational opportunities it offers to people all over the world. The subject property overlies this resource, and the proposed project has the potential to alter the cave environment to its detriment.

The cave channel is wide, high and full of interesting features throughout the upper portion of the property. During my work at the University of Hawaii I have taken part in numerous field trips and excursions for groups of students, visiting scientists, conference participants and Hilo residents. The proximity of the cave to the University and the recreational value for tourism should lead to an analysis of the socio-economic impacts of the proposed project.

The scientific studies conducted in this cave led to discoveries of cave invertebrates with unusual adaptations for living in the moist dark 'oh'a root zone, such as mating songs specific to species living in particular parts of the cave environment. An expert working with NASA on microbiologic habitats in Kaumana Cave has recently discovered new and undescribed forms of life which utilize the rock substrate as a nutrient source. Scientists working on the root environment in the lava tube have published papers on the important contributions these microhabitats have on the forest environment above.

For this reason, a full examination of the project for the potential impact on the natural resources must include the impact of forest clearing, grading, terrain alteration, collapse, septic wastewater contamination, pesticide application on the subterranean invertebrate communities, agricultural nutrient enrichment of the thin soil substrate, and more, on the scientific value of the Kaumana cave.
We are mystified that although the project consultants are aware of the cave, only consideration of the terrestrial flora and fauna were included in the studies. Likewise, a map of the cave was not included although the document refers to the selection of an alternate site for the Pualaniaka Extension road due, in large part, to concerns regarding the cave feature.

A cursory reference to the thickness of the lava substrate in the upper portion of the proposed project is not substantiated by any survey in the appendices. The collapse of a cave is a common occurrence when bulldozing takes place over a large cavern, and presents a danger both to the construction crew and to the project outcome. For this reason, a characterization of the cave and its relation to the surface should be included.

Kaumana Cave is listed in virtually every tourist publication printed or published about the Big Island. How would a person who visits the cave feel if they knew that multiple septic multiple systems (built to manage the human waste of 300 people) were seeping to the permeable rock above their heads? The project, as described, would do just this.

While it is clear to us that ground alteration and tree removal would adversely affect the known Kaumana cave section of the upper lot, we are not currently aware of the subterranean characteristics of the lower lot. It may be that school construction on the lower lot could be accomplished without significant environmental impact, and we request that this alternative be evaluated.

We request a full disclosure and discussion of these issues in the final Environmental Assessment. Further, we request that an Environmental Impact Study be conducted, and that it include a thorough examination of the potential adverse and substantial environmental impacts on this highly prized resource. I would further request that Sierra Club Moku Loa Group be included in the scoping for the EIS.

Please note and correct the following errors:
Numerous misspellings of Gerrish (Garish, Gerish) references in AECOS Appendix.

Ua mau ke ea o ka 'aina i ka po'o

CPCS and WCP are preparing a Revised Draft EA for this project, which will address the reconfigured campus layout, any potential effects on Kaumana Cave and mitigation measures, as warranted.

In response to your comments on the Draft EA, we offer the following:

Comment #1 – A full disclosure of environmental impacts was not performed in this document. A discussion of the many impacts to Kaumana Cave was not included. Therefore, a Finding of No Significant Impact should not be recommended and a full EIS is requested.

Impacts to Kaumana Cave were inadvertently overlooked. As mentioned previously, the campus layout is being reconfigured to avoid Kaumana cave. School buildings would not be developed on the upper parcel (above Edita Street) under which the accessible portion of the cave is located. Campus buildings would be developed exclusively on the lower parcel, and a minimum 100-foot protective buffer around the small segment of the cave system known to exist near the northern edge of the property would be observed.

Comment #2 – A discussion of the flora and fauna of Kaumana Cave was omitted. A discussion of the cave’s biological resources will be included Revised Draft EA.

Comment #3 – Concern expressed about the thickness of the lava tube roof.

Existing information that addresses the estimated thickness of the lava tube roof will be investigated and information included in the Revised Draft EA. However, since no development is being planned directly over the alignment of Kaumana Cave, or within 100-foot of the cave, risk of collapse resulting from the proposed project should not longer be an issue for CPCS.

Comment #4 – Concern expressed about use of a septic system at the project site in relation to location of Kaumana Cave.

Because the reconfigured campus layout limits major development to the property’s lower parcel, there will be no septic system within close proximity to Kaumana Cave. Please note that the EA addresses the proposed master plan for the campus. Detailed design and engineering have yet to be undertaken for the project. Other more environmentally-friendly methods to treat wastewater on site are being explored.

Comment #5 – Request that an alternative be developed to limit construction to the lower portion of the parcel, as well as information about the subterranean character of this portion of the parcel.

As state above, a reconfigured campus plan is being developed that limits construction of major school facilities to the lower portion of the property. Please note that at this stage of the planning process only conceptual plans are being prepared. The EA addresses the campus master plan, which is needed to secure the land lease from the State of Hawai‘i. Once the lease is obtained and further funding becomes available, additional studies can be
conducted as needed, to prepare more detailed architectural and engineering plans during the design development phase. Such additional studies would likely include a geotechnical survey of the area to be built upon in order to develop adequate structural designs needed to support school facilities.

We appreciate the time and effort you put forth in your comments to the draft EA for this project. Thank you for participating in the environmental review process with us.

Sincerely,

Celia Shen

September 4, 2009

Will Chee Planning and Development
1018 Palm Drive
Honolulu, HI 96814

Dear Mr. Chee,

I am commenting on the proposal to build a school campus for Connections Charter School over the Kaumana Cave in Hilo.

The stability of this (or any) lava tube is in question, particularly on the seismically active island of Hawai‘i. Despite what is stated in the proposal, no geological survey of the cave’s roof or its stability has been performed. The safety of students and school staff would be in jeopardy, as would the safety of heavy equipment operators working on construction.

Earthquakes, including major ones, are common on the Island of Hawai‘i. Heavy rains commonly send tremendous amounts of water down from both Mauna Loa and Mauna Kea into the watershed that encompasses this area. Both floods and earthquakes can destabilize large lava tubes.

Kaumana Cave is a natural resource used by many visitors and students to learn about the features and wonders of lava tubes. Proposing to build on top of it will likely include damage to the cave, accidentally or purposely (attempting to stabilize structures on top). There are many poor ways to try to stabilize lava tubes and few good ones.

Lava tubes and other caves are commonly included in Hawaiian sacred places. Many include burials and other religious sites. Damage to Kaumana Cave in the course of this construction would show a lack of respect for Hawaiian culture.

Due to the presence of Kaumana Cave, I do not believe that the Connections Charter School project should be approved at this site.

Sincerely,

Ruth Levin

Subject: Draft Environmental Assessment for Connessions Public Charter School Master Plan, South Hilo, Hawai‘i, TMK (3) 2-5-006:141

Dear Ms. Levin,

Thank you for your comments dated September 4, 2009 concerning the Draft Environmental Assessment for the Connessions Public Charter School (CPCS) Master Plan. Wil Chee - Planning & Environmental (WCP) and CPCS greatly appreciate the time and effort you committed to providing information regarding Kaumana Cave. A detailed discussion of Kaumana Cave and any impacts potentially resulting from the project was not omitted intentionally, and we are grateful for your efforts to make us aware of the cave system's sensitive nature.

One of the primary visions for the new campus is to develop the property in an environmentally friendly and responsible way, with particular effort to leave as much of the natural environment intact as possible. Due to the concerns we received regarding Kaumana Cave, CPCS and WCP have decided to reconfigure the site plan for this project in order to avoid the cave and any potential conflicts. Development of major school facilities are now being proposed within the property's lower parcel, below Edita Street. While a small segment of Kaumana Cave may underlie a portion of the lower parcel's northern corner, indications are that this segment of the cave was closed off when Edita Street was constructed in the 1950s, and is likely inaccessible. Due to safety concerns and to protect the Kaumana Cave, the revised campus plan will maintain a minimum 100-foot buffer between any school facility and the cave. Enclosed for your information is a brief description and conceptual drawings of the reconfigured campus plan.

CPCS and WCP are preparing a Revised Draft EA for this project, which will address the reconfigured campus plan, any potential effects on Kaumana Cave and mitigation measures, as warranted.

In response to your comments on the Draft EA, we offer the following:

Comment #1 - The stability of the lava tube is in question. The safety of the students, staff, and construction workers would be in jeopardy.

There will no longer be any structures built overlying any part of Kaumana Cave. A 100-foot protective buffer surrounding the cave will be observed on the both the upper and lower portions of the property to protect the cave system and to prevent risk of injury from collapse.

Comment #2 - Risk of damage to Kaumana Cave from the proposed project is a concern.

The condition of Kaumana Cave is also a concern to CPCS and WCP. The campus plan has been revised to avoid damaging the cave. As state above, a minimum 100-foot buffer will be maintained between any school facility and the cave. Thus, no grading or clearing of land above or near the cave will occur.

Comment #3 - Damaging Kaumana Cave would show a lack of respect for Hawaiian culture.

Kaumana Cave was formed during the 1881 Mauna Loa flow. Given its relatively recent origins, the cave is unlikely to contain human burial or native Hawaiian historic/cultural material. However, there are known historic elements within the cave, such as petroglyphs (images and dates pecked into cave walls) and electrical insulators attached to the cave wall. Because these elements date back more than 50 years, they do impart historic significance to the cave. We are conducting ongoing consultation with the State Historic Preservation Division to ensure that any historic and cultural resources would not be adversely affected by the project. The revised campus plan should alleviate any concerns regarding the cave's structural integrity or impacts to the historic, cultural and natural resources associated with the cave.

We appreciate the time and effort you put forth in your comments to the draft EA for this project. Thank you for participating in the environmental review process with us.

Sincerely,

Celia Shea
Planner

COMMENTS

(XX) We confirm that the project site, according to the Flood Insurance Rate Map (FIRM), is located in Flood Zone X. The National Flood Insurance Program does not have any regulations for developments within Zone X.
(XX) Please note that the remainder of the project site according to the Flood Insurance Rate Map (FIRM), is located in Zone ___.
(XX) Please note that the correct Flood Zone Designation for the project site according to the Flood Insurance Rate Map (FIRM) is ___.
(XX) Please note that the project site must comply with the rules and regulations of the National Flood Insurance Program (NFIP) presented in Title 44 of the Code of Federal Regulations (44 CFR), whenever development within a Special Flood Hazard Area is undertaken. If there are any questions, please contact the State NFIP Coordinator, Mr. Tyho Rytz, of the Department of Land and Natural Resources, Engineering Division at (808) 587-5257.

Please be advised that 44 CFR indicates the minimum standards set forth by the NFIP. Your Community’s local flood ordinance may prove to be more restrictive and thus take precedence over the minimum NFIP standards. If there are questions regarding the local flood ordinance, please contact the applicable County NFIP Coordinator below:

- Mr. Robert Simons at (808) 768-5037 or Mr. Mario Sin Lu at (808) 768-5038 of the City and County of Honolulu, Department of Planning and Permitting.
- Mr. Frank DePace at (808) 911-5083 of the County of Hawaii, Department of Public Works.
- Mr. Franco Corino at (808) 270-7771 of the County of Maui, Department of Planning.
- Mr. Mario Antonio at (808) 241-6120 of the County of Kauai, Department of Public Works.

(XX) The applicant should include project water demands and infrastructure required to meet water demands. Please note that the implementation of any State-sponsored project requiring water service from the Honolulu Board of Water Supply system must first obtain water allocation credits from the Engineering Division before it can receive a building permit and/or water meter.
(XX) The applicant should provide the water demands and calculations to the Engineering Division so it can be included in the State Water Projects Plan Update.

(XX) Additional Comments:

(XX) Other:

Cella Shen
Planner

cc: John Thatcher II, CEO Connections Public Charter School
5. We recommend the use of best management practices (BMPs) for stormwater management to minimize the impact of the project on the existing area’s hydrology while maintaining on-site infiltration and preventing polluted runoff from storm events. Stormwater management BMPs may earn credits toward LEED certification. More information on stormwater BMPs can be found at [http://www3.hawaii.gov/ems/environmental/leed.htm](http://www3.hawaii.gov/ems/environmental/leed.htm).

6. We recommend the use of alternative water sources, wherever practicable.

7. There may be the potential for ground or surface water degradation/contamination and recommend that a study for this project be conducted upon a review by the State Department of Health and the developer’s acceptance of any resulting requirements related to water quality.

Permits required by CWRM:

Additional information and forms are available at [http://www3.hawaii.gov/ems/environmental/permits.html](http://www3.hawaii.gov/ems/environmental/permits.html).

8. The proposed water supply source for the project is located in a designated water management area, and a Water Use Permit is required prior to use of water.

9. A Well Construction Permit(s) is (are) required before any well construction work begins.

10. A Pump Installation Permit(s) is (are) required before ground water is developed as a source of supply for the project.

11. Groundwater withdrawals from this project may affect streamflow, which may require an instream flow standard amendment.

12. A Stream Diversion Works Permit(s) is (are) required before any stream diversion works is (are) constructed or altered.

13. A Well Construction Permit(s) is (are) required before any alteration(s) can be made to the bed and/or banks of a stream channel.

14. A Petition to Amend the Interim Instream Flow Standard is required for any new or expanded diversion(s) of surface water.

15. The proposed source of water for this project has not been identified in this report. Therefore, we cannot determine what permits or petitions are required from our office, or whether there are potential impacts to water resources.

OTHER:

The water demand for this project based on a total of 435 students (80 gallons/student) is 28,160 gpd. This demand is well above the stated 4,200 gpd currently available from Hawaii DWS. While the planned use of treated water for non-potable uses may reduce the actual potable demand, there should be analyses to estimate what the actual demand for potable water would be. If new well construction is required, CWRM permits are required and further analysis should be done to determine if the well/pump capacity would adversely impact the underlying aquifer system or any existing wells in the area. We recommend that any new permits for well construction or pump installation be thoroughly discussed in the final version of the environmental assessment.

If there are any questions, please contact Lance Ohye at 687-0210.

DWR-PA 06/19/2008

VOL. 1201 - PLANNING & ENVIRONMENTAL

October 15, 2010

Lance N. Ohye
Acting Deputy Director
Dept. of Land and Natural Resources, Commission on Water Resource Management
P.O. Box 621
Honolulu, Hawaii 96809

Subject: Revised Draft Environmental Assessment for the Connections Public Charter School Master Plan, TMK (3) 2-5-406:341

Dear Ms. Ohye,

We have received your memorandum dated September 15, 2010 concerning the above referenced Revised Draft EA. In response to your questions, we offer the following:

1. We recommend coordination with the county to incorporate this project into the county’s Water Use and Development Plan.

During design development, the County of Hawai‘i DWS would be provided with maximum daily water usage calculations prepared by a professional engineer licensed in the State of Hawai‘i. Calculations would quantify the estimated water demand for the proposed project, so that it can be included in the county’s water plan.

2. We recommend that water efficient fixtures be installed and water efficient practices implemented throughout the development to reduce the increased demand on the area’s freshwater resources.

The use of water efficient fixtures is already being planned for the new campus. The specific types of fixtures will be determined during the design phase of the project. As it is the school’s intent to develop a sustainable campus, water efficient practices would also be implemented once the school is in operation.

3. We recommend the use of best management practices (BMPs) for stormwater management to minimize the impact of the project to the existing area’s hydrology while maintaining on-site infiltration and preventing polluted runoff from storm events.

In the short-term, appropriate BMPs would be implemented during construction to minimize the potential for stormwater impacts. In the long-term, the campus would be designed using Low Impact Development strategies to reduce and manage stormwater runoff from the site.
4. We recommend the use of alternative water sources, wherever practicable.

Because of the limited amount of water to be provided by DWS, Connections already plans to utilize alternative water sources (rainwater catchment and recycled water) to the maximum extent possible. Alternative water sources would be used for all non-potable uses, including toilet flushing, landscape irrigation and for the agricultural program.

5. While the planned use of harvested rainwater for non-potable uses may reduce the actual potable demand, there should be analyses to estimate what the actual demand for potable water would be. If new well construction is required, CFWM permits are required and further analysis should be done to determine if the well/pump capacity would adversely impact the underlying aquifer system or any existing wells in the area. We recommend that any new permits for well construction or pump installation be thoroughly discussed in the final version of the environmental assessment.

It is Connections intention to develop an environmentally sustainable campus, which includes minimizing its use of fresh potable water. Every effort would be made to meet the school’s water needs with alternative water sources (i.e., rainwater and recycled water), which would be given priority consideration above potable well development. Use of rainwater and recycled water would be utilized to the maximum extent possible, not only to reduce their demand on the municipal water supply, but to demonstrate their commitment to sustainability.

During the project’s design phase, detailed analysis would be conducted to generate a more accurate estimate of potable water demand. Analysis would take into account, among other things, the number and type of fixtures to be used in the facility (e.g., waterless urinals, high efficiency, dual-flush toilets, etc.), to what extent rainwater and recycled water can be utilized in place of potable water, and if needed, where development plans could be scaled back to contain potable water demands within the DWS allocation. For example, Connections could choose to retain certain functions at the Kress building in downtown Hilo (e.g., kitchen), which would further reduce the potable water usage at the project site.

However, if during design development, it becomes evident that developing a potable may be needed, additional detailed analyses would be conducted to determine any potential adverse effects associated with this alternative, including impacts on other wells and the underlying aquifer. If warranted, a Supplemental EA could be prepared specifically to address this issue if its implementation emerges as a viable option.

An expanded discussion related to the project’s water supply, including permits and requirements related to potable well development, is included in the Final EA.

Discussion related to these permits has been added to the Final EA.

Thank you for your comments and for participating in the environmental review process.

Sincerely,

[Signature]

Subject: Comments on the Revised Draft Environmental Assessment (DEA) for the Connections Public Charter School Master Plan
South Hilo, Island of Hawaii, Hawaii
TMK: (3) 2-5-006:141

Dear Mr. Thatcher:

The Department of Health (DOH), Clean Water Branch (CWB) has reviewed the subject document and offers these comments on the project. Please note that our review is based solely on the information provided in the subject document and its compliance with Hawaii Administrative Rules (HAR), Chapters 11-54 and 11-55. You may be responsible for fulfilling additional requirements related to our program. We recommend that you also read our standard comments on our website at http://www.hawaii.gov/health/environmental/water/cwe-planning/landuse/CWB-standardcomment.pdf.

1. Any project and its potential impacts to State waters must meet the following criteria:

   a. Antidegradation policy (HAR, Section 11-54-1.1), which requires that the existing uses and the level of water quality necessary to protect the existing uses of the receiving State water be maintained and protected.

   b. Designated uses (HAR, Section 11-54-3), as determined by the classification of the receiving State waters.

   c. Water quality criteria (HAR, Sections 11-54-4 through 11-54-8).

2. You may be required to obtain a National Pollutant Discharge Elimination System (NPDES) permit for discharges of wastewater, including storm water runoff, into State surface waters (HAR, Chapter 11-55). For the following types of discharges into Class A or Class 2 State waters, you may apply for NPDES general permit coverage by submitting the applicable Notice of Intent (NOI) forms:

   a. Storm water associated with construction activities, including excavation, grading, cleaning, demolition, uprooting of vegetation, equipment staging, and storage areas that result in the disturbance of equal to or greater than one (1) acre of total land area. The total land area includes a contiguous area where multiple separate and distinct construction activities may be taking place at different times on different schedules under a larger common plan of development or sale. An NPDES permit is required before the start of the construction activities.

   b. Discharges of hydrotesting water.

   c. Discharges of construction activity dewatering.

You must submit a separate NOI form for each type of discharge at least 30 calendar days prior to the start of the discharge activity, except when applying for coverage for discharges of storm water associated with construction activity. For this type of discharge, the NOI must be submitted 30 calendar days before the start of construction activities. The NOI forms may be picked up at our office or downloaded from our website at http://www.hawaii.gov/health/environmental/water/cleanwater/forms/genpermit-index.html.

3. For types of wastewater discharges not covered by an NPDES general permit or discharges to Class AA or Class 1 State waters, you may need an NPDES individual permit. An application for an NPDES individual permit must be submitted at least 180 calendar days before the commencement of the discharge. The NPDES application forms may be picked up at our office or downloaded from our website at http://www.hawaii.gov/health/environmental/water/cleanwater/forms/indiv-index.html.

4. Please note that all discharges related to the project construction or operation activities, whether or not NPDES permit coverage is required, must comply with the State's Water Quality Standards. Noncompliance with water quality requirements contained in HAR, Chapter 11-54, and/or permitting requirements, specified in HAR, Chapter 11-55, may be subject to penalties of $25,000 per day per violation.
Mr. John L. Thatcher II, CEO
September 27, 2010
Page 3

If you have any questions, please visit our website at
http://www.hawaii.gov/health/environmental/water/cleanwater/index.html, or contact the
Engineering Section, CWB, at (808) 586-4309.

Sincerely,

ALEC WONG, P.E., CHIEF
Clean Water Branch

cc: Ms. Celia Shen, WL Cheo - Planning & Environmental
    [via e-mail cahew@wphawaii.com only]
    DOH-SPO-I-3512 [via e-mail only]

October 15, 2010

ALEC WONG, P.E., Chief
State Department of Health, Clean Water Branch
P.O. Box 3178
Honolulu, Hawai‘i 96801-3378

Subject: Revised Draft Environmental Assessment for the Connections Public Charter
         School Master Plan, TMK (3) 2-5-006:141

Dear Mr. Wong,

We have received your comments dated September 27, 2010 concerning the above referenced
Revised Draft EA. We acknowledge your comment that if the proposed project has the potential
to impact State waters it must meet the Antidegradation policy, Designated uses, and water
quality criteria. We also note that a general or an individual National Pollution Discharge
Elimination System (NPDES) permit may be required for the project and that the project must
comply with the State’s Water Quality Standards, regardless of whether or not NPDES permit
coverage is required. Notation of these applicable regulations will be made in the Final EA.

Thank you for providing this information and for participating in the environmental review
process.

Sincerely,

Celia Shen
Planner

cc: John Thatcher II, CEO Connections Public Charter School
Mr. John L. Thatcher II
September 30, 2010
Page 2

2. Additionally, the draft EA indicates that if it is determined that the estimated potable water demand cannot be contained below the allowable maximum of 4,200 gpd, the project will be scaled back or other sources of potable water could be investigated (e.g., wells).

   a. A well developed for this project will qualify as a source that serves a regulated public water system. Federal and state regulations define a public water system as a system that serves 25 or more individuals at least 60 days per year or has at least 15 service connections. All public water system owners and operators are required to comply with Hawaii Administrative Rules (HAR), Title II, Chapter 20, entitled "Rules Relating to Potable Water Systems."

   b. All new public water systems are required to demonstrate and meet minimum capacity requirements prior to their establishment. This requirement involves demonstration that the system will have satisfactory technical, managerial, and financial capacity to enable the system to comply with safe drinking water standards and requirements.

   c. Projects that propose development of new sources of potable water serving or proposed to serve a public water system must comply with the terms of HAR 11-20-29. This section requires that all new public water system sources be approved by the Director of Health prior to its use. Such approval is based primarily upon the submission of a satisfactory engineering report, which addresses the requirements set in HAR Section 11-20-29, entitled "Use of new sources of raw water for public water systems."

   d. The engineering report must identify all potential sources of contamination and evaluate alternative control measures, which could be implemented to reduce or eliminate the potential for contamination, including treatment of the water source. In addition, water quality analyses for all regulated contaminants, performed by a laboratory certified by the State Laboratories Division of the laboratory of the state of Hawaii, must be submitted as part of the report to demonstrate compliance with all drinking water standards. Additional parameters may be required by the Director for this submittal or additional tests required upon his or her review of the information submitted.
Mr. John L. Thatcher II  
September 30, 2010  
Page 3

e. All public water system sources must undergo a source water assessment, which will delineate a source water protection area. This process is preliminary to the creation of a source water protection plan for that source and activities which will take place to protect the drinking water source.

f. All public water systems must be operated by certified distribution system and water treatment plant operators as defined by HAR Chapter 11-25, entitled “Rules Pertaining to Certification of Public Water System Operators.”

g. For further information concerning the application of capacity, new source approval, operator certification, source water assessment, backflow/cross-connection prevention or other regulated public water system programs, please contact the Safe Drinking Water Branch Engineering Section at (808) 586-4258.

If there are any questions, please call Jennifer Nakaide at (808) 586-4258.

Sincerely,

STUART YAMADA, P.E., CHIEF  
Safe Drinking Water Branch  
Environmental Management Division

---

October 15, 2010

Stuart Yamada, P.E.  
Branch Chief  
Dept. of Health, Safe Drinking Water Branch  
P.O. Box 3378  
Honolulu, Hawai'i 96801-3378

Subject: Revised Draft Environmental Assessment for the Connections Public Charter School Master Plan, TMK (3) 2-5-066141

Dear Mr. Yamada,

We have received your letter dated September 30, 2010 concerning the above referenced Revised Draft EA. Thank you for providing information on the applicable requirements and regulations pertaining to the use of a dual water system.

It is the intention of Connections Charter School to develop a sustainable campus, thus the use of rainwater and recycled water would be utilized to the maximum extent possible, not only to reduce their demand on the municipal potable water supply, but to demonstrate their commitment to sustainability. Development of a potable water well would be an option of last resort. We acknowledge your concern that if a well is developed for potable water, it would be categorized as a public water system. As a public water system, it would be subject to compliance with HAR 11-20 “Rules Relating to Potable Water Systems,” which includes the demonstrated ability to meet minimum capacity requirements, approval by the Director of Health of the public water system source(s), submission of a satisfactory engineering report, and a source water assessment. We further note that the public water system must be operated by a certified distribution system and water treatment plant operator as defined in HAR 11-25 “Rules Pertaining to Certification of Public Water System Operators.” An expanded discussion related to the project’s water supply, including requirements related to potable well development, is included in the Final EA.

Again, thank you for providing the applicable regulatory information to us and thank you for participating in the environmental review process.

Sincerely,

Colia Shan  
Planner

September 16, 2010

Mr. John L. Thatcher II, CEO
Connections Public Charter School
174 Kamahana Avenue
Hilo, Hawai‘i 96720

Dear Mr. Thatcher:

SUBJECT:  Comments on Revised Draft Environmental Assessment
Project:  Connections Public Charter School Master Plan
TMK: (3) 2-5-066:141; Ponahawai and Kohala 2nd, South
Hilo, Hawai‘i

This letter is prepared in response to correspondence dated August 17, 2010, providing
this office with a copy of a Revised Draft Environmental Assessment (DEA) prepared
pursuant to Hawai‘i Revised Statutes, Chapter 343 and Administrative Rules, Title 11,
Chapter 200.

The Connections Public Charter School is proposing to open a new campus to
consolidate the existing academic programs at a single location, plus provide land area
and facilities to expand their academic offerings. Facilities included would accommodate
the pre-K, elementary, intermediate, and high school programs and supporting services,
an agricultural program, and a small dormitory facility. Connections is pursuing a long-
term land lease agreement with the current property owner, the State of Hawai‘i.

The subject property is zoned A-1a (Agricultural—minimum 1 acre lot size) and is situated
within the State Land Use Agricultural District. In addition, according to the County of
Hawai‘i General Plan 2005 (amended December 2006), the subject property is designated
as Low Density Urban by the Land Use Pattern Allocation Guide. The parcel is not
located in the Special Management Area.

Sincerely,

BJ LEEIHBEAD T O D D
Planning Director

County of Hawai‘i, Planning Department
101 Pauahi Street, Suite 3
Hilo, Hawai‘i 96720

Subject: Revised Draft Environmental Assessment for the Connections Public Charter School Master Plan, TMK (3) 2-5-006:141

Dear Ms. Leithhead Todd,

We have received your comments dated September 16, 2010 concerning the above referenced Revised Draft EA. We note that the County of Hawai‘i’s General Plan LUAPG designation for the subject parcel is Low Density Urban and not Urban Expansion as stated in Section 1.5 of the EA. This designation is corrected in the Final EA. We also note that the EA references an incorrect chapter of the HRS relating to the Hawai‘i State Plan. This too is corrected in the Final EA.

Thank you for participating in the environmental review process.

Sincerely,

Celia Shen
Planner

cc. John Thatcher II, CEO Connections Public Charter School

SEPTEMBER 21, 2010

Mr. John L. Thatcher, CEO
Connections Public Charter School
174 Kamakamoku Avenue
Hilo, HI 96720

REvised DRAFT ENVIRONMENTAL ASSESSMENT
CONNECTIONS PUBLIC CHARTER SCHOOL MASTER PLAN
TAX MAP KEY 2-5-006:141

We have reviewed the subject Revised Draft Environmental Assessment (RDEA) and have the following comments.

1. We can confirm that the current water availability conditions in the area, which are subject to change without notice, can provide up to seven (7) units of water per pre-existing lot of record. Each unit of water is limited to a maximum daily usage of 600 gallons; therefore, our existing water system can only provide a maximum of 6,000 gallons per day for the subject parcel.

2. As stated in the subject RDEA, the Department will require that water usage calculations be provided by a professional engineer, licensed in the State of Hawai‘i, showing the estimated probable water demand for the project.

3. The Department has no objections to the proposed use of a private rainwater catchment system to supplement the water needs of the proposed project. However, the water system plumbing between the potable water system and proposed catchment water system shall not be interconnected.

4. A reduced pressure type backflow prevention assembly must be installed within five (5) feet of the meter serving the project. The installation of the backflow prevention assembly must be inspected and approved by our Department before water service can be activated.

5. As the Department’s Water System Standards do not cover catchment water systems, plan review by our Department will be limited to the service lateral, water meter, and backflow prevention assembly installation only.

Should there be any questions, you may contact Mr. Glenn McCall of our Water Resources and Planning Branch at 961-8070, extension 255.

Sincerely yours,

Millen D. Pargo, P.E.
Manager

Subject: Revised Draft Environmental Assessment for the Connections Public Charter School Master Plan, TMK (3) 2-5-006:141

Dear Mr. Pavao,

We have received your comments dated September 30, 2010 concerning the above referenced Revised Draft EA. We acknowledge your confirmation that the existing water system in the project area can only provide a maximum of 4,200 gallons per day to the subject parcel. We also acknowledge that the Department has no objection to the use of a private rainwater catchment system to supplement the project’s water needs. Further, we note that the Department’s Water System Standards do not cover catchment systems and that your plan review will be limited to the service lateral, water meter, and backflow prevention assembly installation.

Lastly, we reaffirm the statement made in the Revised Draft EA that water usage calculations that estimate the project’s possible water demand will be provided to the Department.

Thank you for providing this information and for participating in the environmental review process.

Sincerely,

Celia Shea
Planner

From: Fred D. Stone, Ph.D.
   P.O. Box 1430
   Kailua-Kona, HI 96740
   Tel: 808-961-7361

Dear Mr. Chee,

I have reviewed the amended draft EA for the proposed Connections Charter School. I am pleased that you have included my comments and materials in the current draft EA. I believe the plan to move the school to the lower parcel is an acceptable solution. However, I am strongly opposed to alternatives 1, 2 and 3, in which buildings are placed over or directly adjacent to Kaumana Cave on the upper property. These should not be presented as acceptable alternatives.

I do have a concern about the proposed nature trail boardwalk on the upper parcel. The idea of the nature trail is excellent, but it should not be necessary to remove `ohi’a trees in order to build the trail. I have walked on many such boardwalks in other places, and the more common solution is to either make the trail zig-zag around the tree, or make a puka in the trail surrounding the tree. This integrates the natural feature as part of the experience of walking the trail.

I suggest that the plan to uproot native plants be extended to landscaping for the lower parcel.

The idea of making Kaumana Cave part of the educational experience is also excellent, and I am willing to volunteer to help the Connections Charter School develop a sound plan to make this part of their curriculum.

Sincerely,

Fred D. Stone

Subject: Revised Draft Environmental Assessment for the Connections Public Charter School Master Plan, TMK (5) 2-5-006:141

Dear Dr. Stone,

We have received your comment letter dated September 14, 2010 concerning the above referenced Revised Draft EA. We are pleased that you find the reconfigured campus plan acceptable.

Your opposition to the presentation of alternatives 1, 2 and 3 in the EA as acceptable alternatives is noted. While these alternatives could be less preferable from an environmental standpoint, we believe that they could potentially be feasible and will remain in the EA as alternatives considered. Further, we believe that inclusion of these alternatives documents the evaluation and decision-making process undertaken to identify and develop the most environmentally preferred alternative—the Proposed Action, particularly in light of the new information that was brought to our attention later in the planning process.

In constructing the elevated walkway on the upper parcel, it is the intent to leave as many of the ‘ōhi’a trees in place as possible. However, it cannot be guaranteed that no trees would be removed. Topographical limitations and the need to meet ADA requirements may preclude the desire to leave all ‘ōhi’a trees intact. Be assured that every attempt would be made to minimize any removal of ‘ōhi’a trees when laying out the alignment and constructing the elevated walkway. As well, opportunities to outplant native species within the lower parcel’s landscaping will be identified and implemented wherever possible.

Lastly, we appreciate your generous offer to assist Connections Charter School with incorporating management and protection of Kaunana Cave into their educational curriculum. We will keep this in mind as we move forward with the project.

Thank you for your input and for participating in the environmental review process.

Sincerely,

[Signature]

Biological surveys for the Kaʻūmana Charter School
Parcel, Hilo, Hawaiʻi

February 23, 2009

AECOS Consultants
45-300 Akinala Pl.
Kīhei, Hawaiʻi 96744

INTRODUCTION

This report summarizes the findings of the botanical, invertebrate, avian and mammalian surveys conducted within the proposed project property. The primary purpose of the surveys was to determine if there were any botanical, invertebrate, avian or mammalian species currently listed as endangered, threatened, or proposed for listing under either the federal or the State of Hawaiʻi's endangered species programs or within the immediate vicinity of the site. We were also asked to evaluate the potential impacts that the development of the Kaʻūmana School campus might pose to any sensitive or protected native botanical, invertebrate, avian or mammalian species, and to propose appropriate minimization and/or mitigation measures that could be implemented to reduce or eliminate any such impacts. Federal and State of Hawaiʻi listed species status follows species identified in the following referenced documents (Division of Land and Natural Resources (DLNR) 1998, Federal Register 2005, U. S. Fish & Wildlife Service (USFWS) 2005, 2008a). Fieldwork was conducted in December 2008.

The subject parcel is actually two parcels divided by Edits Road (Fig. 1). Most of all of the property lies between the 920 m and 600 m elevation, on a Mauna Loa pahoehoe lava flow dated 1881. Consequently, the long term history of disturbances to the natural environment begins in 1881 when lava destroyed a relatively narrow swatch (varies, but on the order of 500 m or 1600 ft) of native forest, and does not include clearing for agricultural uses as typifies surrounding lands. Soils on the relatively recent lava flow are too thin to support pasturing of animals or sugar cane cultivation.

¹ Montana Matters, Waiʻalae
² Rama Production Ltd., Kailua-Kona
METHODS

Place names follow Place Names of Hawaii (Pukui et al. 1974). Although the team spent one day together on site, each member followed up with additional survey effort as appropriate to complete the individual responsibilities.

Botanical Survey Methods

The botanical survey was undertaken on December 10-11, 2008 by Eric Guinther. The survey methodology utilized a wandering transect, whereby the botanist walked around the property visiting representative areas of the vegetation, and noting the occurrence of all species of ferns and flowering plants encountered. Relative abundance (for this location) of each species was recorded. This method (as opposed to say, utilizing fixed transects) provides better cover and likelihood of recording uncommon and rare species, but is less precise with respect to actual abundance of each species. Species requiring additional identification were photographed and specimens taken for workup in the laboratory.

Conditions during the survey were ideal. Although the site is located in a wet area and the survey undertaken during the wet season, the weather was generally sunny and mild. Plant names follow Hawaii’s Ferns and Fern Allies (Palmer, 2003) for ferns, Manual of the Flowering Plants of Hawai‘i (Wagner et al., 1990, 1993) for native and naturalized flowering plants, and A Tropical Garden Flora (Staples and Herbst, 2005) for crop and ornamental plants.

Invertebrate Survey Methods

Invertebrates are certainly the numerically dominant fauna in natural Hawaiian environments. The primary emphasis of this survey conducted by Dr. Steven Montgomery was on terrestrial invertebrates, particularly those that are endemic, indigenous, or listed species having legal status under either, or both federal and state endangered species statutes (DLNR, 1996, 1997; USEFS, 2005a, 2006).

Field surveys were conducted November 2008-January 2009 at the Kamana site. A general assessment of the terrain and habitats was conducted at the start of the survey. Surveying efforts were conducted at various times of day and night, a technique which is vital for a thorough survey of invertebrates, many of which are crepuscular or nocturnal. The native floral resources were an important focus of searches for native insects.

Dr. Montgomery has taken part in field projects at other locations in similar environments on Hawai‘i and throughout the island chain since 1969. Those experiences and the results of those surveys provide the basis for the study design and analysis of results used here. The following survey methods for terrestrial invertebrates were used as appropriate to the terrain, botanical resources, and target species. Species names follow Hawai‘i Biological Survey (2002), Nishida (2002), Zimmerman (1948-80), and Zimmerman (2001).

Host plant searches — Potential host plants, both native and introduced, were searched for arthropods that feed or rest on plants. The Kamana School property was traversed in a wandering manner, crisscrossing areas to access potential host plants.

Light survey — A survey of insects active at night is vital to a complete record of the arthropod fauna. Many insects are only active at night to evade birds, avoid desiccation and high temperatures, or to use night food sources, such as night blooming flowers. Light sampling uses a bright light source in front of a white cloth sheet (Figure 2). Nocturnal insects seem to mistake the collecting light for the light of the moon, which they use to orient themselves. In attempting to navigate by the scientist's light, confused insects are drawn around the light and land on the cloth in confusion. This type of survey is most successful during the dark phase of the moon or under clouds blocking starlight. Vegetation usually blocks light from being seen over long distances, and most moths and other night fliers are not capable of very distant flight. Consequently, light surveying does call in many insects from outside the survey area.

The monitoring location was chosen based on experience, host plant proximity, and terrain (Figure 1). The light source was an ultra violet (UV) or black light bulb, a light wave length known to be attractive to night active insects. Light surveying began on Jan 18, 2009, at dark (approximately 6:30 p.m.) and was conducted throughout the night. Although the moon was a waxing crescent with 42% of the visible disk illuminated, it did not rise until 1:41 a.m. on Jan 19, 2009, leaving many moon-free hours for monitoring (USNCS). Additionally, some arthropods were attracted to the light even after moonrise.
Sweep nets — This method assists in surveying many flying and perching insects. A fine mesh net is swept across plants, leaf litter, rocks, etc. to census any flying, perching or crawling insects.

Visual observation — vigilance is maintained for visual or aural evidence of arthropods. Visual observations provide valuable information and are a cross check that extends the reach of survey techniques. Visual observation also includes turning over rocks, dead wood, and other debris.

Survey limitations/conditions — The survey schedule and duration were adequate to assess potential impacts of the proposed project on invertebrate resources. The survey was representative and targeted to locate and examine host plants which might be utilized by native invertebrates. Nevertheless, my ability to form advisory opinions regarding the invertebrates present is limited by several factors.

1. Common alien species: No attempt was made to document the many common alien arthropod species present in the area. With introduced plants dominating much of the property, the number of alien invertebrates encountered was high.

2. Physical limitations: The size of the project area allowed a fairly comprehensive survey. Utile fern mats made chasing arthropods in flight difficult. Nevertheless, in most situations, it was possible to obtain access to host plants of interest. The light survey compensated well for some reduced access.

3. Survey conditions: Monitoring at different time of the year, or for a longer period of time, might produce a longer or different arthropod list. Weather and seasonal vegetation play an especially important role in any survey of invertebrates. Many arthropods habitually emerge and breed to overstep or follow seasonal weather or to coincide with growth spurts or fruiting of an important plant food. The absence of host plants, however, was a stronger factor affecting the invertebrate species noted than seasonal changes, weather, or other causes.

Weather was favorable for surveying during each day of fieldwork. This study was conducted during the winter season, ensuring that the few native host plants were in a stage adequate for surveying. As the survey was conducted over several months, varying conditions were encountered. Thanks are extended to Roland Reeve for arranging first transects, and to Eric Guenthner for maps and assistance with access to the site. Azita Manning contributed to preparation of this report. Steven Lee Montgomery conducted all surveying and is responsible for all conclusions.

Avian Survey Methods

Eight bird count stations were situated along a linear transect running the length of the property. Count stations were placed at approximately 200-meter intervals equally spaced along the transect. Eight-minute point counts were made at each of the eight count stations. Each station was counted once. Field observations were made with the aid of Leitz 10 X 42 binoculars and by listening for vocalizations. Counts were concentrated in the early morning hours, traditionally the peak of daily bird activity. Time not spent counting was used to search the remainder of the project site for species and habitats that were not detected during count sessions.

Mammalian Survey Methods

With the exception of the endangered Hawaiian hoary bat (Lasiurus cinereus seminulatus), or 'opu'a as it is known locally, all terrestrial mammals currently found on the island of Hawai'i are alien species. Most are ubiquitous. The survey of mammals was limited to visual and auditory detection, coupled with visual observation of scat, tracks, and other animal sign. A running tally was kept of all vertebrate species observed, heard or detected by other means within the project area. Mammal scientific names follow Mammals in Hawaii (Tomich, 1986).
RESULTS

Botanical Survey Results

The results of the botanical survey include a listing of the plants encountered (the flora) and a description of the vegetation. Scientific and common names of the plants observed on the project site are given in Table 1, grouped by higher taxa. The total number of vascular plants (ferns, fern allies, conifers, and flowering plants) encountered was 65. The "Status" column indicates whether a species is non-native ("Nat"), native ("Ind"), or native and "indigenous" ("Ind.""); see notes at end of Table 1. Of the 65 species identified on the Katumana Charter School property, 11 are native (indigenous or endemic) to the Hawaiian Islands. The total number of species is not very high considering the size of the parcel, however, the nature of the assemblage (that is, mostly undisturbed and dominated by a few native species) accounts for this result. Abundance estimates in the listing are averaged approximations for the project area.

Table 1. Flora listing for the Katumana Charter School Parcel, December 2008.

**Legend to Table 1.**

- **STATUS** = distributional status for the Hawaiian Islands.
  - end. = endemic; native to Hawaii and found naturally nowhere else.
  - ind. = indigenous; native to Hawaii, but not native in the Hawaiian Islands.
- **ABUNDANCE** = occurrence ratings for plants by area.
  - R = rare
  - U = unknown
  - O = common
  - D = abundant
  - O = Occasional
  - C = Common
  - A = abundant
  - Observed numerous times during the survey
  - Found in large numbers may be locally dominant
  - AA = Abundant and dominant defining vegetation type
  - AB = Abundant and dominant defining vegetation type
  - AL = Abundant and dominant defining vegetation type

- Numbers following an occurrence rating indicate distances within the survey area. The ratings above provide an estimate of the likelihood of encountering a species within the survey area; numbers mostly fall abundance, where encountered, tends to be greater than the occurrence rating.

- **NOTES:**
  - (1) = species mostly or entirely associated with recently disturbed areas on the property.

A common lichen in the survey area is British soldier lichen (*Cladonia sp.*). At least two species of mosses (unidentified) are present as well.

**Vegetation:** All or nearly all of the property is located on the Mauna Loa lava flow of 1881. Thus, we know the vegetation at this site "started over" as it were after 1881. The site has been disturbed more recently, but the majority of the land remains undisturbed and the vegetation reflects the largely native plant community that developed after 1881.
gradually reclaiming the bare lava flow. In the 128 intervening years, a native forest dominated by 'ōhi'a (Metrosideros polymorpha) trees with a dense understory of 'alehe (Dicranopteris linearis) fern came to be established here; this is a Lowland Wet Forest (Cagney and Cuddihy, 1980) of type termed: 'ōhi'a/alehe (Metrosideros/Dicranopteris). The dense 'alehe fern is effective at keeping most other species out and the density of the 'ōhi'a trees varies considerably from place to place, but typically approaches a closed canopy where undisturbed. Soils are thin on the recent pahoehoe lava flow (Seitz, et al., 1973).

As the surrounding properties came to be developed and the saddle road built, opportunities opened for non-native species to invade the native plant community. This process has been slow, but has been accelerated where the native community is disturbed, either by clear-cutting, grubbing, or, in the case of Road, cutting the property into two parcels with complete removal of a swath of the native plants.

It is interesting to note that during the plant survey, the southern end of the parcel was reached after a relatively long, meandering trek down slope. Lacking knowledge of exact location, a point was reached where there was seen to be a dramatic shift in the nature of the vegetation, with many species appearing that had not been previously recorded (the property was initially surveyed from southwest to northeast). A forest dominated by strawberry guava (Psidium cattleianum) and an absence of 'ōhi'a and 'alehe was entered, and many other non-native species were being recorded, including large albizia (Falcariar moluccana) trees. Finally, the transect reached the dry streambed of Waipahosho Stream and it then became evident that the survey track had left the the 1861 lava flow and the eastern end of the Kaimana Charter School property. The species recorded in this area were not included in our report, but suffice it to say, the difference in vegetation between that associated with the 1861 lava flow, and that not on the lava flow is striking. At least two important factors are operating here: deeper soils and (as a consequence) a past history of agricultural land use after clearing of the native forest.

Invertebrate Survey Results

Native Hawaiian plant, vertebrate, and invertebrate populations are often interdependent. Certain insects are obligatorily attached to specific host plants, using only that plant as their food. These insect relationships with hosts are ancient and often intertwined. The health of native Hawaiian invertebrate populations depends upon habitat quality and absence or low levels of predators introduced from the continents. Sufficient food sources, host plant availability, and the absence or low levels of introduced, continental predators and parasites comprise a classic native, healthy ecosystem. Consequently, where appropriate in the survey discussion, host plants and some introduced arthropods are also noted.

The results of day and night invertebrate surveys are presented in Table 2. Native species observed on the property are discussed below and information is provided on several alien species frequently observed by the public that may be misidentified or confused with native species. Alien species that affect the survival of native species and species that impact human health also are discussed.

**Native Arthropods**

**LEPIDOPTERA**

One species of *Hypomnas coconuts*, as caterpillars, was found on the rocky surfaces. Properly called "case bearers," the caterpillars are sometimes misleadingly called "bagworms." Very young caterpillars of case bearers find safety in a hiding place like a leaf curl. When growth forces them out of that protection, they industriously weave a portable shell of their own silk from a lip spinneret. For camouflage, they add bits of their surroundings to the case using silk: snips of dry grass or leaves, flakes of bark, maybe a little soil. The case is then easily mistaken by a predator as another part of the landscape. These bunkers are fitted with a hinged lid (operculum), pulled shut by mimetic parts to defraud them from enemies like beetles and micro wasps. Their relationship to the case is similar to that of a hermit crab to his shell. Although not physically connected to the case as a snail or turtle, they are dependent on it, and die if removed—even if protected from predators and given food. They don't move far, but head while partly emerged from the case, dragging along their protective armor by their six true legs. (Manning/Montgomery in Lüthschwager & Middleton 2001) With over 5000 kinds, *Hypomnas coconuts* are the greatest assembly of Hawaiian Island moths, showing astounding diversity. After writing 500 pages on them, Dr. Elwood Zimmerman lamented the inadequacy of his study. He noted an enormous cluster of species with explosive speciation and diverging radiation (Zimmerman 1976). Much remains to be learned about the life ways of this interesting group of insects now under study by University of Hawaii's Dr. Daniel Rubinoff and colleagues (Rubinoff et al. 2008).

**Crambidae, Eudonia sp.**

This endemic, narrow winged, speckled moth is represented by more than 30 species known from Hawaii Island of the 60 species in the island chain. One specimen came to the night light during the survey. A typical *Eudonia* feeds on mosses.
Noctuidae: *Schrankia nitidula*

The small native moth, *Schrankia nitidula*, is widespread throughout the Hawaiian Islands. The caterpillar of this endemic moth feeds on 'alii/aerial roosters. The cocoon is protected by camouflage created with bits of root (Fig. 3).

Alien Species: Arthropods

**INSECTA: LEPIDOPTERA**

Noctuidae: *Ascalapha oenos* – Black witch moth

The black witch moth has been widely distributed in the island chain since the 1930s. The classic food plant of the caterpillars, monkeypod (*Sesbania rostrata*), was noted in the area. Near homes the moth is seen resting under the eaves of roofs during the day. In rural areas it rests under foliage and against tree trunks. It is most frequently seen a dawn or dusk. When seen in flight in such low light, this large moth is occasionally mistaken for a bat.

Libellulidae: *Pantala flavescens* Globe skimmer

The indigenous dragonfly *Pantala flavescens* (Fig. 4) is among the most easily observed of the native insects. They are large, easily approached by people, and graceful in flight. Any small amount of fresh water will attract them and they often colonize human maintained water sources such as golf course water hazards or home fish ponds. The adults lay eggs in the water where they develop into young called naiaeds. Mosquito larvae are among the foods of the naiaeds. The proposed habitat change may reduce their numbers, but they are likely to recolonize almost any water source. The native dragonflies are widely distributed throughout the Hawaiian Islands, from Kure to Hawai'i Island (HIS, 2002; Nishida, 2002).

Nymphalidae: *Agraulis vanillae*

The passion vine butterfly (Fig. 5), with its bright orange wings, in quick flight might be mistaken by members of the public for the Kamehameha butterfly (*Vanessa tameana*).
**ODONATA (Dragonflies and Damselflies)**

Acisoma finger (Anax junius - Common green darter)

The common green darter (Anax junius (Drury), 1770) also was seen. This non-native species is widely distributed, being known in North and South America, Europe and parts of Asia. It is sometimes confused with native species.

**ORTHOPTERA (Praying Mantis, Grasshoppers, Crickets, Katydid)**

Tettigonidae: Eumastaculus minuta - Aggravating grasshopper

The distinctive call of the aggravating grasshopper (Fig. 7, above), is heard at dusk and early dark. The sound, a bit like a transformer gone bad, is the call of the male. People often hear the sound, but cannot associate it with the creator.

**Medically Important Arthropod Species**

Invertebrate species likely to be found in the project area and having negative human health impacts include centipedes, and likely brown widow spiders. These species are often disturbed when dead brush or trash is cleared.

**DIPTERA**

Mosquitoes were observed during the survey and most likely breed where water is allowed to stand in discarded containers, and natural depressions. As winter rains intensify, concentrations will increase. In recent years, mosquito transmitted illnesses, such as dengue fever, have been a greater concern for the state’s Department of Health. When work begins on the property and habitat is altered, the mosquito levels should abate.

**HYMENOPTERA**

The ants noted in the survey, long-legged ant (Anoplolepis gracilipes), carpenter ant (Camponotus sericeus) and the big-headed ant (Pheidole megacephala), are not known to bite or sting humans. Caution should be used, however, anywhere nests or large numbers of ants are found.

Honey bees (Apis minima) stings are known to cause severe allergic reactions in sensitive individuals. Unlike honey bees, wasps can sting repeatedly. Paper wasps (Polistes exclamans) were seen in several locations. Mud wasps were not seen, but they can be encountered anywhere in the islands. Not seeing them during the short term of this survey does not mean they are not on the property.

**Avian Survey Results**

Two hundred and fifteen individual birds of 14-different species, representing 15 separate families were recorded during station counts (Table 3). One additional species, Hawaiian Hawk (Buteo solitarius) was detected as an

DISCUSSION

Botanical Resources

Other recent surveys of botanical resources on the 1881 lava flow in the Kaumana area include Garrish (1995) and Palmer & Associates Consulting (1998). The Garrish survey encompassed part of the 1881 flow in the Kaumana Homesteads between 1140 and 1500 ft (350 to 460 m). A total of 26 species were observed from a somewhat smaller area of the flow. The Palmer & Assoc. survey included only a very small part of the 1881 lava flow, around the 1500-ft (460-m) elevation. This flow was described as supporting a forest "in early successional stages with small, widely spaced trees..." The list of characteristic species, both native and non-native, agrees well with the results of our survey, with the exception that two native species, 'ōhai (Sideritis cymiflora) and 'ohelo laʻau (Vaccinium clypeatum), listed as characteristic were not seen on the Kaumana Charter School property.

Garrish (1995) recorded three varieties of 'ōhai in the lava flow forest: M. p. var. inana, var. glabra, and var. ussuriensis. In addition, he found a number of other native plants to be present—kapua (Psychotria humilis), pila (Capromus rigescens), koa (Cibotium spp.)—not recorded for the Kaumana Charter School site. Further, ground cover was dominated by sword ferns (Nephrolepis spp.) and kahili ginger (Hedychium gardnerianum), rather than ʻahuʻē fern. This fern dominated the area surveyed by Palmer & Assoc.

Although certainly not unique for the area, the property does support a largely native ecosystem with respect to the vegetation.

Invertebrate Resources

Plant and invertebrate populations are interdependent. Consequently, host plant presence is one way to describe the health of invertebrate populations. The youth of the area lava flow and native forest it supports, and consequently the very limited diversity of Hawaiian host plants, limited the number and diversity of native invertebrates. The dominance of ʻahuʻē fern, which is largely uninteresting to arthropods, also contributes to keeping the biomass and biodiversity low. Additionally, the low elevation means a higher number of introduced predators, such as ants, have easy access to the native fauna.

Alien predatory ants are a major cause for the scarcity of native arthropods. The long-legged ant (Anoplolepis gracilipes) and the big-headed ant (Pheidole megacephala), which prey on other insects (Zimmerman 1948-80) are present on the property. These ants are well documented as a primary cause of low levels of native arthropods at elevations up to 2300 ft (695 m; Perkins, 1913).

Arthropods Not Present

Although lava tubes are known in the near vicinity, most notably at Kaumana Cave, our survey revealed no caves on the project property. No native mollusks were noted during this survey.

ARTHROPODA: INSECTA

DIPTERA

Drosophilidae: Drosophila

No native Drosophila were observed on the property. The location does not provide appropriate host plants for any of the 12 native Drosophila species recently listed as endangered or threatened by USFWS (2000).

LEPIDOPTERA

Sphingidae: Manduca blackburnii

Blackburn's sphinx moth (Manduca blackburnii), an endangered species (Federal Register, 1999-2002) was not found in this survey. The Final Rule (USFWS, 2003) for this large sphinx moth designated Hawai'i Island habitat only at Pu'u'owalo'a.

Neither the moth's solanaceous native host plant, 'alaia (Nelisiastrum sp.), nor the best alien host, tree tobacco (Nicotiana glauca) were observed in our survey.

Figure 7 (right). Blackburn's sphinx moth (Manduca blackburnii).

Recommendations Relative to Arthropods

Workers (surveyors, environmental assessment teams, construction crews) should be alert for all these species when working on the property as they may pose a serious risk to some individuals. Supervisors should be aware of any special allergy by employees. Some individuals can experience anaphylactic reactions to venoms (e.g., bee stings). When moving brush, stones, or piled brush, the use of gloves and long sleeves in addition to covered shoes & long pants will greatly reduce the risk of accidental contact and bites or stings. Pulling socks up over (outside of) past cuffs reduces the chance of a
stinging invertebrate crawling up a worker's leg (e.g., centipede). See What Bit Me? for
phones and discussion of Hawaii's long-standing pests (Nishida and Tencze, 1993).

Avian Resources

Avian diversity and densities were in keeping with the habitat present within the project
area, and with the results of at least two surveys conducted on properties close to the
subject property in the recent past (David, 2007; David and Polness, 2008), and with
the findings of numerous other surveys conducted in the South Hilo District during
recent years (David, 2001, 2002a, 2002b, 2003a, 2005, 2006a, 2006b; David et al., 2004).

Of the 15 different avian species recorded during this survey all but two are alien to the
Hawaiian Islands (Table 3, above). One species, Pacific Golden-Plover is a commonly
occurring migratory shorebird species that nests in the High Arctic returning to Hawaii's
and the Tropical Pacific during the late summer. They spend the fall and winter months
in the central and southern Pacific, and return to the Arctic in late April and early May.

One species detected as an incidental observation while transecting between two count
stations, Hawaiian Hawk is an endemic endangered species currently protected under
both federal and state of Hawaii's endangered species statutes. This species was first
listed as endangered in 1967 (Federal Register 1967), proposed for down listing from
endangered to threatened in 1993 (Federal Register 1993), and has recently been
proposed for delisting altogether (Federal Register 2008).

One dark phase bird was seen soaring high over the canopy on the northern portion of
the site. Hawaiian Hawks are currently found in nearly all habitats that still have some
large tree components on the island. They are regularly seen foraging in the South Hilo
area. Hawk densities are highest in native, native species dominated forests, with
grassy under stories. This habitat, with high amounts of forest edge, supports large
populations of game birds and the four species of introduced rodents known from the
island, all of which are prey items for the hawk. Additionally, this type of habitat also
provides numerous perches and nesting sites suitable for this species (Klavitter 2000).

The Hawaiian Hawk, or 'Io, is the only extant falconiform in Hawaii. It is currently
endemic to the Island of Hawaii. Sub-fossil remains indicate that it was also formerly
found on Molokai and Kauai (Olson & James 1997). Several incidental, unconfirmed
sightings of this species exist from Kauai (Dole 1879, Bagelholz, 1967) and Maui (Banko
1960). This species was first mentioned in the western literature by Cook and King in
1778 and was scientifically described by Peale in 1848 from a specimen collected in
"Kalihekuak" (Medway 1931, Peale 1848).

The most current population estimates based on John Klavitter's research extrapolates
that there were 1,437 Hawaiian Hawks present on the island in 2000, and that, in his
estimation, represents a population that is equal to or higher than what was present in
pre-contact times (Klavitter 2000). The Hawaiian Hawk breeding season starts in late
March, chicks hatch in May, and begin fledge in July (Griffin et al. 1998). Although
hawks use resources in most forest habitats they usually pick 'ahinu trees (Metrosideros
polymorpha) in which to nest. Of 112 nests found during the 1998 and 1999 nesting
seasons, 82% of the nests were located in 'ahinu trees (Klavitter 2000).

Although not detected during this survey, it is possible that small numbers of the
endangered endemic Hawaiian Petrel (Pterodroma sandvicensis), or ʻa‘a, and the
threatened Newell's Shearwater (Puffinus pacificus), or ʻa‘e, over-fly the project
area between the months of May and November (Banko 1980a, 1980b, Day et al. 2003,
Harrison 1990).

Hawaiian Petrels were formerly common on the Island of Hawaii (Wilson and Evans
1893-1899). This pelagic seabird reportedly nested in large numbers on the slopes of
Mauna Loa and in the saddle area between Mauna Loa and Mauna Kea (Snowball 1932),
as well as at the mid-to-high elevations of Mount Hualalai. Within recent historic times,
Hawaiian petrels have been reduced to relic breeding colonies located at high
elevations on Mauna Loa, and possibly, Mount Hualalai (Banko 1980a, Banko et al.
2001, Cooper and David 1995, Cooper et al. 1995, Day et al. 2003a, Harrison 1990, Hue et

Newell's Shearwaters were formerly common on the Island of Hawaii (Wilson and
Evans 1893-1899). This species breeds on Kauai, Hawaii, and Molokai in extremely
small numbers. Newell's Shearwater populations have dropped precipitously since the
1980s (Banko 1980b, Day et al. 2003b). This pelagic species nests high in the mountains
in burrows excavated under thick vegetation, especially viola (Dinomorphus linearis) fern.

The primary cause of mortality in both Hawaiian Petrels and Newell's Shearwaters is
thought to be predation by alien mammalian species at the nesting colonies (USFWS
is considered to be the second most significant cause of mortality in these seabird species
in Hawaii. Nocturnally flying seabirds, especially fledglings on their way to sea in the
summer and fall, can become disoriented by exterior lighting. When disoriented,
seabirds often collide with manmade structures, and if they are not killed outright, the
dazed or injured birds are easy targets of opportunity for feral mammals (Badley 1961,
Telfer 1979, Simcock 1981, Reed et al. 1985, Telfer et al. 1987, Cooper and Day 1993,
Pedakey et al. 1998, Ainley et al. 2001). There is no suitable nesting habitat within or
close to the project area for either of these pelagic seabird species.
Mammalian Resources

The findings of the mammalian survey are in keeping with the habitat present within the project area, and with the results of at least two surveys conducted on properties close to the subject property in the past (David 2007, David and Palenius 2008), and with the findings of numerous other surveys conducted in the South Hilo District during recent years (David 2001, 2002b, 2003a, 2003b, 2005, 2006a, 2006b, David et al. 2004).

Although, Hawaiian hoary bats were not recorded during this survey, bats have been recorded on numerous recent surveys conducted within the general Hilo area (Bonaccorso et al. 2005, 2007, David 2001, 2002b, 2003a, 2003b, 2005). It can be expected that Hawaiian hoary bats use resources within the general project area on a seasonal basis.

The Hawaiian hoary bat is a typical lasurine bat, and as such, they primarily lead a solitary existence, described as “over-dispersed”. They generally roost cryptically in foliage, which makes them difficult to study (Findley and Tonich 1963, Jacob 1994, Carter et al. 2000). Fundamental research into this species distribution and life cycle has just begun (Bonaccorso et al. 2005, 2007). Data gathered as part of a three year project to study this species, it distribution, densities and life history is just being prepared for publication. Key findings include the opinion that at least on the Island of Hawai‘i, the bat is ubiquitous in areas that still have forest or dense cover. They have also concluded that the species is a human commensal species and has adapted to roost in, and prey upon alien species (Bonaccorso et al. 2005, 2007).

Potential Impacts to Protected Species

Flora

No protected plant species were recorded from the property. In areas further from development (see Palmer and Associates Consulting, 1998), several listed species occur in habitat which differs primarily in occurring on ancient lava flows rather than an historical lava flow.

Invertebrates

No federally or state listed endangered or threatened species (USFWS, 2006) were noted in this survey. No anticipated actions related to the proposed project activity in the surveyed locations are expected to threaten entire species or entire populations. There is no federally designated Critical Habitat for any invertebrate species on or adjacent to the subject property.

Vertebrates

There is a small potential that construction activities or habitat modification associated with this project may result in impacting the following four species, which are all protected under both federal and state of Hawaii endangered species statutes.

Hawaiian Hoary Bat

Hawaiian hoary bats were not detected during this survey, but they have been recorded within the general project area on numerous occasions. With the current scientific information available, it is not known if bats ever roost within the project site. Whether the clearing and the modification of portions of the remaining vegetated areas within this site will result in deleterious impacts to this species is difficult to ascertain. The principal potential impact that clearing and grubbing of the vegetated portions of the site poses to bats is disturbance to roosting female bats during the pupping season, when the females are tending to their young, and are less likely to be able to rapidly vacate a roost tree or bush as it is being felled, or cleared.

Hawaiian Hawk

The principal potential impact that development of this project poses to Hawaiian Hawks is during the clearing and grubbing operations. There is also a small chance that noise associated with the actual construction of the project could disturb birds nesting in the general project area. If disturbed while sitting on eggs or caring for young, adult birds may abandon the nest putting their eggs, and or young, at grave risk of harm or mortality.

Hawaiian Petrel and Newel's Shearwater

The principal potential impact that developing this site poses to Hawaiian Petrels and Newell's Shearwaters is the increased threat that birds will be drowned after becoming disoriented by exterior lighting that may be required in conjunction with construction activities, and, or the servicing of construction equipment at night, and following build-out through street lights and building lights associated with the school facilities.

Potential Impacts to Critical Habitat

There is no federally delineated Critical Habitat within or close to the project site, thus the clearing, grubbing and construction of the proposed school and associated appurtenances will not result in any impacts to federally designated Critical Habitat.

Conclusions

There is nothing unique about the project site or its vegetation. There is abundant like habitat in, and around Hilo. It is not expected that the construction or operation of the
proposed school will result in deleterious impacts to native avian or mammalian resources present within the general project area.

1. To reduce the potential for interactions between clearing grubbing and construction activity and Hawaiian hoary bats, it is recommended that clearing and grubbing not be undertaken during the period that bats are cave for young; namely between the months of May and late July (Menard 2001, Bonaccorso et al., 2005).

2. To avoid disturbance to nesting Hawaiian Hawks audio playback nesting activity surveys should be conducted by a qualified ornithologist on the site where large trees will need to be removed prior to the onset of clearing and grubbing activities. This is to ensure that the construction activities will not disturb nesting Hawaiian Hawks. If nesting activity is detected, consultation with the U.S. Fish & Wildlife Service will be required prior to conducting further clearing activity within 500 meters of the nest tree. The currently approved protocols for conducting such a survey are based on those developed by John Kavitter during his multi-year island wide survey of Hawaiian Hawks (Glavitter, 2000). This recommendation may be mute if the current petition to delist the Hawaiian Hawk is enacted.

3. To reduce the potential for interactions between nocturnally flying Hawaiian Petrels and Newell's Shearwaters with external lights and man-made structures, it is recommended that any external lighting planned to be used during construction be shielded (Reed et al., 1985, Teller et al. 1997). This mitigation would serve the dual purpose of minimizing the threat of disorientation and downing of Hawaiian Petrels and Newell's Shearwaters, while at the same time complying with the Hawaii County Code § 14 - 30 et seq. which requires the shielding of exterior lights so as to lower the ambient glare caused by unshielded lighting to the astronomical observatories located on Mauna Kea.

GLOSSARY

Adventive: organisms introduced to a area but not purposefully.
Alien: occurring in the locality it occupies ONLY with human assistance, accidental or purposeful; not native. Both Polynesian introductions (e.g., coconut) and post-1778 introductions (e.g., guava, goats, and sheep) are aliens.
Anaphylactic hypersensitivity resulting in a sudden severe and potentially fatal allergic reaction, marked by a drop in blood pressure, difficulty in breathing, itching, and swelling.
Arthropod: insects and related invertebrates (e.g., spiders) having an external skeleton and jointed legs.
Endemic: naturally occurring, without human transport, ONLY in the locality occupied. Hawaii has a high percentage of endemic plants and animals, some in very small microenvironments.
Entomology: the study of insects and other arthropods.
Indigenous: naturally occurring without human assistance in the locality it occupies; may also occur elsewhere, including outside the Hawaiian Islands. (e.g., Naupaka kahakai (Scaevola sericea) is the same plant in Hawaii and throughout the Pacific).
Insect: arthropod with six legs, and bodies in 3 sections.
Invertebrate: animals without backbone (insects, spiders, snails / slugs, shrimp).
Larva/larval: an immature stage of development in offspring of many types of animals.
Mollusk: invertebrates in the phylum Mollusca. Common representatives are snails, slugs, mussels, clams, oysters, squids, and octopuses.
Native: organism that originated in area where it lives without human assistance. May be indigenous or endemic.
Nocturnal: active or most apparent at night.
Purposely introduced: an organism brought into an area for a specific purpose, for example, as a biological control agent.
Rare: threatened by extinction and low numbers.
Species: all individuals and populations of a particular type of organism, maintained by biological mechanisms that result in their breeding mostly with their kind.

December 2008
ABSTRACT

At the request of Wil Chee-Planning and Environmental, Inc., Pacific Legacy Inc. conducted an archaeological assessment survey of a 72.34 acre property (TMK 8-1-1001-A1) located within the ‘ahu‘pua‘e of Ponahawal, district of South Hilo, on the island of Hawai‘i. The property is intended to serve as the future campus of the Connections Charter School. No previous archaeological investigations had been conducted in this area. Prior to the field survey, an examination of geologic maps revealed that the project area rests completely within the land covered by the 1860-1861 Mauna Loa lava flow. This historic pāhoehoe flow would have destroyed any pre-existing archaeological structures which might have been located within the project area. For this reason, few archaeological remains were anticipated to be found. In order to determine whether any archaeological sites did exist on the property, Pacific Legacy archaeologists conducted a pedestrian survey of the project area. The dense nature of the area’s vegetation made survey conditions difficult. In all, a total of 12 transects were walked. These transects were spaced throughout the project property, providing a representative sample of all areas. No archaeological sites were noted along any of the transects. This suggests that human activity within the area since the time of the 1860-1861 flow has been minimal, probably being limited to the passage of the occasional pig hunter. Given the relatively recent nature of the area’s geology and the fact that no structural features were noted during the survey, it is felt that the development of the Ka‘ūma‘a parcel will not impact any archaeological resources. Underground lava tubes are, however, known to exist within the area of the 1881 flow. The main entrance to the Ka‘ūma‘a Cave complex is located just west of the property on the opposite side of the road. One lava tube, known to run beneath the western half of the property, and another located just outside the property boundary were investigated and found to be subject to periodic flooding during times of heavy rainfall. Such flooding would have washed away any cultural remains or human burials previously extant within the caves. Due to the dense nature of the vegetation presently covering the property, there exists the possibility that as of yet undiscovered lava tubes may exist within the project area. It is suggested therefore that an archaeological monitor be on call during construction activities in order to inspect any previously undiscovered lava tubes that may be encountered.

1.0 INTRODUCTION

At the request of WL Chee-Planning and Environmental, Inc., Pacific Legacy Inc., conducted an archaeological assessment survey of a 7.34 acre property (TMK (3) 2-2-006J-141) located within the ahupua'a of Ponahawa, District of South Hilo, on the Island of Hawai'i. The property is intended to serve as the future campus of the Connections Charter School.

1.1 PROJECT AREA

The project area is located on the lower slopes of the shield dome volcano of Mauna Loa, inland of the town of Hilo (Figure 1). While the bulk of the property is situated within the ahupua'a of Ponahawa, a very small sliver along its southern edge falls within the ahupua'a of Kukuaa 2 (Figure 2). The project area is situated east of the settlement of Kaimana and immediately south of Kaimana Drive. The property is divided into almost equal halves by Edita Street, which runs southeast from Kaimana Drive cutting through the center of the project area (Figure 3). As can be seen in aerial photographs, the parcel is edged along much of its perimeter by residential houses (Figure 4). The majority of these houses are of relatively recent construction, having been built within the last 10 to 15 years. Just west of the property, on the far side of Kaimana Drive, is the main entrance to the Kaimana lava tube complex, which has been designated as Kaimana Caves County Park. A branch of this lava tube complex runs under the western half of the project area, ending at an opening along the western edge of Edita Street.

The property is situated between approximately 600 and 900 feet in elevation. Its western (upper) half extends from about the 750 to 900 foot contours, while its eastern (lower) half extends from about the 600 to 750 foot level. The terrain is gently sloping from west to east.

The underlying geology of the project area is distinct from that of the lands lying immediately north and south of it, for it rests completely within the course of the 1880-1881 lava flow (Figure 5). This narrow tongue of pahoehoe lava originated on the slopes of Mauna Loa and flowed down slope toward Hilo, halting just two miles short of the town. The lava of the 1880-1881 flow are Kaa Basalts and consist of relatively smooth surfaced pahoehoe that has been distorted by uplifts and pressure fractures (Wolfe and Morris 1996:11-12). Very little soil has developed atop the flow, and the official soil designation for the area is simply "lavas, pahoehoe" (PLW) (Sato 1978:24).

The closest source of potable water is the Waipiohe Stream, which flows north of the project area, passes close to its eastern corner, and eventually feeds into the Wai'ao River. Waipiohe Stream can be translated as "pahoehoe (smooth lava) water" (Pukui et al. 1974:227). The rainfall within the area is between 6000 millimeters (c. 160 inches) and 5000 millimeters (c. 200 inches) annually. Despite the lack of soil, this relatively high rainfall has resulted in the area being blanketed in dense vegetation.
The composition of the vegetation covering the project area, though relatively similar, differs slightly between the western and eastern halves of the property. The western (upland) half of the project area is covered almost exclusively in native vegetation. This consists of an open canopy forest of scattered 'akio (Pteleosideros sp.) trees with an understory of 'ilima (Dermopteris linearis) fern (Figure 6). The 'ilima ferns form a dense tangle of intertwining fronds. This mat of vegetation, which in places stands up to 8 or more feet in height, makes passage through the area difficult. It also makes it virtually impossible to examine the ground surface more than a meter on either side of the cut trail.

In the eastern (lower) half of the project area, the vegetation is slightly thinner in places, with a mix of native and non-native species. The non-natives are more common along the outer edges of the property. The dominant non-native species is strawberry guava (Psidium cattleianum), which grows in dense stands along the southern boundary of the project area.

Figure 6: Vegetation in the upper project area as seen from Edita Drive (View West).
2.0 HISTORIC BACKGROUND

2.1 Pre-Contact Period

There is very little evidence for any human activity within the project area during the pre-contact period. Boundary Commission testimony indicates that bird hunting was carried out in the forests further inland at a place known as Kalapalapuanu ("the boundary between Waiakea and Kaimana runs south to Kalapalapuanu, an old place where we used to catch birds") (Boundary Commission Book 2, 23). It is probable that the forested area around what is now Kaimana settlement.

2.2 Historic Period

At the time of the Māhele 'Āina (land division, also known as the Great Māhele) in the 1840s, when the private ownership of land was first established in the Hawaiian Islands, two parcels adjacent to the project area were awarded to native claimants.

Land Court Award parcel 8521-8 was awarded to George Hu'e Davis, the son of Isaac Davis, an advisor to Kamehameha I. From his father, George Hu'e Davis (sometimes referred to in land court and other early documents as C. D. Hui or George Hu'e) inherited claim to the alii's of Kukua 2 in the district of Hilo, Waikoloa in South Kohala and Ke'hae in South Kona. Unlike many Land Court Award claims, which contain information on the use of the property at the time of the claim (what was grown on it, whether there was a house there, etc.) George Hu'e Davis' claim covers such a wide area that the document contains no direct information on the Kukua parcel.

The Land Court Award parcel (number 4980) is located immediately north of the project area. It was claimed by an individual named Kukua, indicating that there was at least some human activity around the project area in the early historic period.

During the years 1830 and 1881, a lava flow that originated on the slopes of Mauna Loa passed down through the slopes of Mauna Loa burying everything in its path (Figure 5). As this flow approached and threatened Hilo, the people of the town called upon Princess Ruth Ke'elikolani Keahamoe and Ke'ahamoe for help. Princess Ruth was well known and loved for her adherence to traditional Hawaiian ways. The residents of the threatened community requested that she interceded on their behalf with the volcano goddess Pele, whose fiery flow was threatening their homes. Hawaiian language newspapers of the time reported that Princess Ruth journeyed to the lower edge of the flow where she chanted and made offerings to the goddess. That evening she lay down to sleep in the path of the lava. The next morning the flow had stopped in front of the sleeping princess (Silver n.d.:3). Though it spared Hilo, the 1880-1881 flow did inundate the present project property. This lava would have destroyed any evidence of previous human activity in the area.

3.0 FIELD INVESTIGATIONS

3.1 Field Methods

Since no previous archaeological investigations had been conducted within the project area, a pedestrian field survey of the property was performed. This survey was undertaken by Pacific Legacy archaeologists Rowland B. Reves and Jenny Schabell over the two day period of November 6th and November 7th, 2008. Justin Thatcher, a resident of Kaimana who is familiar with the subject property, graciously volunteered to act as guide during the survey. The field crew was also accompanied by biologist Steven Montgomery who was conducting an entomological survey of the project area. Paul Clagborn, Ph.D. served as the Principle Investigator for the project.

Given the geologic history of the project area, few archaeological remains were anticipated to be encountered during the survey. On various pig hunting forays into the project area, Mr. Thatcher noted the presence of what appeared to be badly disturbed historic walls near the course of Waipio Stream, just outside the property, and had found historic bottles associated with these walls. As a result, it was felt that the greatest potential for encountering sites was in eastern (lower) half of the project area, at its eastern corner and along its northern edge where the property lies closest to Waipio Stream. Field survey was therefore begun in the eastern half of the project area. The first transect line started at the property's eastern corner and ran along its northern boundary. It soon became apparent that the dense nature of the area's vegetation and the resulting lack of visibility (Figures 7 and 8) would make it impossible to run an expanded sweep line with team members spread out every 10 to 20 meters. For safety reasons the survey team was kept in close proximity as it moved along each transect line.

In all, a total of 12 transects were walked. These transects were spaced throughout the project property, providing a representative sample of all areas. Four relatively lengthy transects were run through the eastern (lower) half of the project area, while 1 long and 7 shorter transects were run through the property's western (upper) half (Figure 9). Fortunately, the Lycoming Junior High School had previously cut a roughly 2 to 3 meter wide trail down the center of the western half of the project property and it was possible not only to use this trail as a transect, but to cut transects perpendicular to it extending out to the edges of the property (Figures 10 and 11).
3.2 FINDINGS

No archaeological sites were encountered along any of the transects walked during the course of the survey. This was not surprising given the relatively recent nature of the area's geology. Even in those areas closest to Waipioho'oe Stream there is not enough soil development to have encouraged agricultural activity within the area following the 1800-1801 lava flow. It appears that, following the flow, all permanent human use of the project area ceased. At present the area appears to be visited only by the occasional pig hunter.

It is impossible to tell what, if any, archaeological sites may have existed in the project area prior to 1880. Boundary commission records indicate that bird hunting was carried out in the forests further mauka (inland), and we know that the more mauka (coastal) village of Hilo was a major pre-Contact settlement and agricultural area. As for Kaimana itself, it may have held scattered homesteads, probably located along the course of Waipioho'oe Stream. If such a homestead did exist within the project area, it would have been destroyed by the 1800-1801 lava flow.

Underground lava tubes are known to exist within the area of the 1800-1801 flow. The main entrance to the Kaimana Cave complex rests just north of the property on the opposite side of the road. One lava tube runs beneath the western half of the property and the entrance to another is located just outside the property boundary. Both of these tubes were investigated during the present survey. They were found to be subject to periodic flooding during times of heavy rain. Such flooding would have washed away any cultural remains or human burials previously extant within the caves.
4.0 SUMMARY AND RECOMMENDATIONS

No archaeological surface features were encountered during the survey of the Kauffman project parcel. Any sites that may have existed in the project area prior to the 1880-1881 lava flow would have been destroyed at that time. The absence of sites suggests that human activity within the property since 1880 has been minimal, probably being limited to the passage of an occasional pig hunter. Given this lack of observed structural features, and taking into consideration the relatively recent nature of the project area's geology, it is felt that the development of the Kauffman parcel will not impact any archaeological resources.

Due to the dense nature of the vegetation presently covering the property, there exists the possibility that as of yet undiscovered lava tubes may exist within the project area. Such tubes have the potential to contain human remains. It is therefore suggested that an archaeological monitor be on call during any construction activities in order to inspect any previously undiscovered lava tubes that may be encountered.

June 2010
This brief report presents the results of an archaeological field inspection conducted within a portion of the Kālimana Cave located in Hilo, Hawai'i. It is intended to serve as an addendum to the "Archaeological Assessment Survey of the Connections Charter School Kālimana Property, South Hilo District, Island of Hawai'i," a report prepared for Will Chase Planning by Pacific Legacy Inc. and submitted in December of 2005. This initial report documented the surface examination of a 72.34 acre property (TKM 5-2-2-03/6241) located within the ahupua'a of Ponahawai, District of South Hilo, on the island of Hawai'i (Figure 1). The property is intended to serve as the future campus of the Connections Charter School. The Archaeological Assessment Survey found no surface archaeological remains to be present within the two parcels that comprise the property (Figure 2).

An examination of geological maps undertaken at the time of the Assessment Survey revealed that the project area rests completely within the land covered by the 1880-1881 Mauna Loa lava flow. This historic pāhoehoe flow would have destroyed any pre-existing archaeological structures which might have been located within the project area. The flow, however, also created a number of subsurface lava tubes, some of which run beneath the survey property. Just west of the property, on the far side of Kālimana Drive, is located the main entrance to the Kālimana lava tube complex, which has been designated as Kālimana Crises County Park. A branch of this lava tube complex runs under the western half of the project area, ending at an opening along the western edge of Edith Street. This opening has been barred to prevent access, and a culvert has been dug to divert flood waters flowing out of the cave from crossing Edith Street. Conversations with local residents indicated that this and other tubes in the area are subject to periodic flooding during times of heavy rainfall. At the time the Assessment Survey was conducted it was felt that such flooding would have washed away any cultural remains or human burials that might have been previously extant within the caves.

Following completion of the Archaeological Assessment Survey, Dr. Fred D. Stone, a geology professor at the University of Hawai'i, Hilo, raised concerns as to the possibility that historic remains might rest within the section of Kālimana Cave that extends beneath the project area. These concerns were included among comments he made to the draft Environmental Assessment for the Connections Charter School property (Stone 2009). According to Dr. Stone, "early visitors to the cave chipped their names and dates into the glasy lava tube lining, and this is now part of the cave history. Electrical transformers attached to the cable wall indicate that at some past date, the cave had been wired for visitors" (Stone 2009:10). In order to address Dr. Stone's concerns and to determine whether any historic elements did indeed exist within the limits of the Connections Charter School parcel, an archaeological field inspection of the cave was undertaken.
This archaeological field inspection was conducted on the 24th of June, 2010 by Pacific Legacy archaeologist Rowland Reese. He was accompanied by Mr. John Thatcher, headmaster of the Connections Charter School. A map of the cave system, showing its relationship to the surface property boundaries, had been prepared by Will Chee Planning from existing sources (including both a 1953 survey and a 1992 Hawaii County survey of the lava tube). This map was utilized as a guide while exploring the cave. The “Punalu’u Road Extension Environmental Impact Study: Kaumana Cave” (Stone 1992), a report prepared in 1992 by Dr. Stone, which provides a detailed description of the cave, was also used for reference during the field inspection.

The inspection was begun at the Kaumana Caves County Park entrance. A thorough examination was made of the lava tube as it extended malei (down slope) as far as the barred exit at Edita Street. Although a map of the cave extending for half a mile beyond this point was prepared in 1953 by Coors, Moore and Carroll (Stone 1992), at present this lower portion of the tube is no longer accessible, having been sealed off by the construction of Edita Street. Due to the lack of access, it is impossible to say for certain whether any historic properties exist within this lower section of the cave. However, descriptions of the more malei portions of the tube provided by members of the Hilo Lions Club who explored the cave to a distance of 4,700 feet in 1953 (Halliday 1957) make no mention of any cultural remains. The Lions themselves did, however, leave behind a banner and document which now, if they still exist, could be considered historic elements.

No attempt was made to examine the branch of the lava tube running west from the County Park entrance, as it extends away from the Connections Charter School project area.

Although the walls and ceiling of the lava tube were thoroughly examined, no evidence was found of the “electrical insulators attached to the cave wall” that were mentioned by Dr. Stone (Stone 2009:10).

In contrast, the “names and dates [chipped] into the glassy lava tube lining” (Stone 2009:10) were clearly in evidence. An abundance of pecked names were found in the illuminated area directly inside the entrance. Further back into the cave the names became more sporadic, with dense concentrations along stretches where the walls were smooth and glassy (Figure 3). An annotated version of the Will Chee Planning map (Figure 4) shows the approximate locations of these names concentrations in relation to the Connections Charter School project area, while a more detailed map from the 1953 survey shows the main concentrations (Figure 3). The deepest concentration of names was encountered at approximately 850 feet in from the entrance, almost directly beneath Kaumana Drive. This is well west of the Connections Charter School property. Beyond this point only two sets of pecked names were noted, both of which appear to be of relatively recent age. In addition, several names had been spray painted onto the cave walls. No names that appeared to be older than 50 years in age were found within those sections of the cave that run below the Connections Charter School property.
Though many of these pecked names are clearly modern, others appear (based upon the dates associated with them) to stretch back into the early 20th century. Photographs of a number of these historic names have been included at the end of this report. The earliest date noted was 1915 (Figure 8). Other early names and with dates are from the late 1920s, the 1930s and the 1940s (Figure 7). Several names appear to be associated with a visit to the cave made in 1939 by the Nippon Jinenka Club (Figure 8). Other names date from the Second World War and appear to have belonged to servicemen visiting the cave (Figure 9).

The names and dates pecked into the walls of Kaimana Cave provide a unique and valuable historic record. None of these names, however, are likely to be impacted by development planned for the Connections Charter School property. Not only do none of these historic names occur in the deeper sections of the cave that run beneath the school property, but the present plan for the property calls for construction to take place only within the main parcel, east of Edita Street. All construction within this lower parcel is planned to be located well away from the projected extent of the cave (based upon the 1953 map). The more remote parcel (west of Edita Street) is planned to be set aside as a natural area used only for educational programs and reforestation projects. The sole structure within this upper parcel would be a raised wooden walkway that would extend the length of the parcel. This walkway would be elevated off the ground, requiring only shallow footings and posts to support it. It would also be located outside a 100-foot buffer around the cave.

With the exception of the carved names, no historic elements were noted during the field inspection of Kaimana Cave. Any portable historic remains that may once have been present are likely to have been washed away by periodic flooding. As Dr. Stone indicated in his 1992 report, “According to residents across the road from this [the Edita Street] entrance, during heavy rains in the mid-1970s, Kaimana Cave flooded and water gushed from the cave and covered Edita Street” (Stone 1992:5).

In summary, the present archaeological field inspection encountered no historic remains within those accessible portions of Kaimana Cave that extend beneath the Connections Charter School property. The use of both the upper and lower Kaimana parcels by the Connections Charter School, as presently planned, should have no impact on any historic properties present within the lava tube.

Cultural Impact Assessment Correspondence
April 23, 2010

Edith Kaaeka'ole Foundation
1500 Kahanamoku Avenue
Hilo, HI 96720-4914

Dear Sirs/Madams,

Subject: Environmental Assessment for Connections Public Charter School
Alupus'a of Puna Hawaiian District of South Hilo, TMK (3) 2-5-006:141

Connections Public Charter School (CPCS) is proposing to develop a new campus in Kaumana, Hilo, Hawaii', on land to be leased from the State Department of Land and Natural Resources (DLNR). The new campus would allow CPCS to expand their educational offerings, consolidate their elementary, intermediate, and high school programs at one location, and develop a campus that would be a model of sustainable development.

The property on which CPCS would like to develop their new campus is approximately 72 acres in size and is identified by TMK (3) 2-5-006:141 (refer to Enclosure Figure 1). It is situated on the lower slopes of Mauna Loa, inland from the town of Hilo, at an elevation that ranges between 600-900 feet. The parcel is located off of Kaumana Drive and is separated into two sections, at its narrowest point, by Edita Street. The property is bounded along much of its perimeter by residences on Kaumana Drive, Edita Street and Molokana Street (refer to Enclosure Figure 2). West of the property, on the other side of Kaumana Drive, is the main entrance to the Kaumana lava tube complex, which has been designated as Kaumana Caves County Park. A branch of this lava tube complex runs under the western half of the project area, ending at an opening along the western edge of Edita Street.

The property is currently undeveloped. The upper or western portion of the property (above Edita Street) is mostly covered by native vegetation consisting of an open canopy forest of ohia trees with an understory of uhele fern. The lower or eastern portion of the property (below Edita Street) is covered by a mix of native and non-native species, such as strawberry guava.

Wil Choe - Planning & Environmental is assisting CPCS prepare a Campus Master Plan and Environmental Assessment (EA), which is needed to secure their lease from DLNR. As part of the EA process, we are trying to obtain information to assess cultural impacts. As an organization that may have knowledge of traditional cultural properties or cultural practices that may occur at or within the immediate vicinity of the property, we kindly ask your assistance to identify potential impacts. To facilitate information gathering, we have enclosed a questionnaire form.

Sincerely,

Celia Sten

Kape Maly
554 Keauoua Street
Hilo, HI 96720

Dear Mr. Maly,

Subject: Environmental Assessment for Connections Public Charter School
Ahuopua'a of Puna Wai, District of South Hilo, TMK (3) 2-5-006:141

Connections Public Charter School (CPCS) is proposing to develop a new campus in Kaumana, Hilo, Hawai'i, on land to be leased from the State Department of Land and Natural Resources (DLNR). The new campus would allow CPCS to expand their educational offerings, consolidate their early childhood, middle and high school programs at one location, and develop a campus that would be a model of sustainable development.

The property on which CPCS would like to develop their new campus is approximately 72 acres in size and is identified by TMK (3) 2-5-006:141 (refer to Enclosure Figure 1). It is situated on the lower slopes of Mama Loa, inland from the town of Hilo, at an elevation that ranges between 600-900 feet. The parcel is located off of Kaumana Drive and is separated into two sections, at its narrowest point, by Edna Street. The property is bounded along much of its perimeter by residences on Kaumana Drive, Edna Street and Methusalem Street (refer to Enclosure Figure 2). West of the property, on the other side of Kaumana Drive, is the main entrance to the Kaumana lava tube complex, which has been designated as Kaumana Caves County Park. A branch of this lava tube complex runs under the western half of the project area, ending at an opening along the western edge of Edna Street.

The property is currently undeveloped. The upper or western portion of the property (above Edna Street) is mostly covered by native vegetation consisting of an open canopy forest of ohia trees with an understory of 'elepaio fern. The lower or eastern portion of the property (below Edna Street) is covered by a mix of native and non-native species, such as strawberry guava.

Wil Chee - Planning & Environmental is assisting CPCS prepare a Campus Master Plan and Environmental Assessment (EA), which is needed to secure their lease from DLNR. As part of the EA process, we are trying to obtain information to assess cultural impacts. Kapolei, HI 96707

Subject: Historic Preservation Review of the Archaeological Assessment Survey for the Connections Public Charter School Property, Kaūmana, South Hilo, Hawai‘i

Dear Ms. Aiu,

By this letter, Wil Chee – Planning & Environmental is hereby requesting a review of the archaeological assessment survey report and an issuance of a letter of “no effect” for the Connections Public Charter School project. Enclosed is the SHPD submittal sheet, a hardcopy of the Archaeological Assessment Survey report and a check for $50.

The original assessment report was completed in August 2008 and was appended to the Draft EA, which was distributed for public and agency review in August 2009. After the conclusion of the comment period, SHDP requested additional investigation of Kaūmana Cave be conducted. The field inspection was completed in June 2010 and has been appended to the original assessment report, which is enclosed in its entirety. The Kaūmana Cave investigation found no historic remains within the accessible portion of the cave that underlies the subject property. Further, due to concerns raised about the project, the campus plan was redesigned by relocating all major school facilities to the property’s lower parcel and limiting development in the vicinity of the cave to a lightweight elevated walkway. The investigation therefore concluded that the project should have no impact on any historic resources within the cave. A Revised Draft EA addressing the reconfigured campus plan is being distributed for review and comment.

If you have any questions, please free to contact me at 596-4688 or at cshen@wcphawaii.com.

Regards,

Re: Traffic Impact Analysis Report
Connections School
Hilo, Hawaii
TIMK: (9) 2-5-6:141

Dear Celia:

Phillip Rowell and Associates have completed the following Traffic Impact Assessment Report (TIA/R) for the proposed Connections School in the Kaumana area of Hilo. The report is presented in the following format:

A. Project Location and Description
B. Purpose and Objective of Study
C. Methodology
D. Description of Existing Streets and Intersection Controls
E. Existing Peak Hour Traffic Volumes
F. Level-of-Service Concept
G. Existing Levels-of-Service
H. Background Traffic Projections
I. Project Trip Generation
J. Background Plus Project Traffic Projections
K. Traffic Impact Analysis
L. Mitigation
M. Other Traffic Related Issues
N. Summary and Conclusions

A. Project Location and Description

The proposed project is located in the Kaumana area of Hilo as shown on Attachment A.

The proposed school will be developed in six phases with full development completed in 2022. The development phases are summarized in Table 1.

Table 1 Summary of Development Plan By Phase

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
<th>Start Construction</th>
<th>Completion Year</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

<td>Construct Pre-Kindergarten Facilities</td>
<td>2021</td>
<td>2022</td>
</tr>
</tbody>
</table>

Notes:
(1) As completion date for the phases were not provided, it was assumed that construction would be completed in approximately 12 months after start of construction.

There are three alternative development plans (Alternatives A, B and C) and a preferred alternative. All development plans divide the campus into a Lower Campus, north of Edilla Street, and an Upper Campus, south of Edilla Street.

Alternative 1

Alternative 1 is referred to as the "Consolidated Campus Layout" and a schematic drawing of the layout is provided. Under Alternative 1, the Lower Campus consists of the caretaker's residence, barn, and agriculture program facilities. Primary access to and egress from the project will be via the intersection of Kaumana Drive and Edilla Street. Access and egress for the Lower Campus will be provided by the edye along the north side of Edilla Street. This driveway is referred to as Road 'A'. The Upper Campus consists of the educational facilities, which include the dorms, elementary, middle and high schools, pre-kindergarten and gymnasium. Access and egress is provided via a driveway along the south side of Edilla Street, referred to as Drive 'B'. This driveway should be aligned with the driveway serving the Lower Campus.

Alternative 2

Alternative 2 is referred to as the "Split Campus Layout." A schematic drawing of this alternative is provided. Under Alternative 2, the high school, dorms and agricultural facilities will be located on the Lower Campus and the elementary school, intermediate school and gymnasium will be on the Upper Campus. Primary access to and egress from the project will be via the intersection of Kaumana Drive and Edilla Street. Access to and egress from the Lower Campus will be provided by a new driveway referred to as Road 'A'. Access to and egress from the Upper Campus will be provided by a new driveway referred to as Road 'C'. Road 'C' is a semi-circular driveway intersecting Edilla Street approximately 150 feet east of Kaumana Drive and approximately 500 feet east of Kaumana Drive. The second intersection is aligned with Drive 'A' that serves the Lower Campus. As the nearest intersection with Edilla Street nearest Kaumana Drive overlaps with the existing westbound left turn lane, use of this driveway should be restricted to right turns in and right turns out only.
Ms. Celia Shen
June 28, 2010
Page 3

Alternative 3

Alternative 3 is a variation of Alternative 2 as shown on Attachment D. The Lower Campus and the Upper Campus consists of the components described as Alternative 2 and there are two driveways along Edita Street serving the Upper Campus. In addition, there is a fourth driveway along Kaumana Drive at the north end of the project. To minimize the impacts of this driveway on traffic along Kaumana Drive and to address sight distance issues, use of this driveway should be restricted to right turn in and right turns only.

Preferred Alternative

The Preferred Alternative is shown on Attachment E. No major school facilities are proposed for the upper parcel. A walkway is being proposed for the upper parcel to provide access and viewing opportunities within the forested area. This walkway is the only structure being proposed for the upper parcel. All major school facilities are now proposed to be located within the lower parcel. Access and egress will be provided via a new driveway along the north side of Edita Street. This driveway is referred to as Road "D." All traffic movements will be allowed at this driveway.

B. Purpose and Objective of Study

1. Quantify and describe the traffic-related characteristics of the proposed project.

2. Identify potential deficiencies adjacent to the project which impact traffic operations in the vicinity of the proposed project.

C. Methodology

1. Define the Study Area

The first step in defining the study area was to estimate the number of peak hour trips that the proposed project will generate. Based on a review of studies for other projects in the area, it was determined that the study area should include the intersection of Kaumana Drive at Edita Street and the project driveways along Edita Street and Kaumana Drive. The study intersections are summarized in Table 2.

<table>
<thead>
<tr>

<tr>
<td>Subaruma Drive at Road &quot;B&quot;</td>
<td></td>
</tr>
<tr>
<td>Edita Drive at Road &quot;O&quot;</td>
<td></td>
</tr>
</tbody>
</table>

2. Analyze Existing Traffic Conditions

Existing traffic volumes at the study intersections were estimated from manual traffic counts performed Thursday, May 28, 2009. The intersection configuration and right-of-way controls were verified during a field reconnaissance of the study area during April, 2009. Existing traffic operating conditions of the study intersection were determined using the methodology described in the 2000 Highway Capacity Manual (HCM).3

3. Estimate Horizon Year Background Traffic Projections

Background traffic conditions are defined as future traffic conditions without the proposed project. The design horizon year does not necessarily represent the project completion date or that phase. It is a date for which future background traffic projections were estimated. For this project, we have used a design, or horizon year of 2022. Horizon year background traffic conditions were estimated using a background traffic growth factor.

4. Estimate Project-Related Traffic Characteristics

The number of peak-hour trips that the proposed project will generate was estimated using standard trip generation procedures outlined in the Trip Generation Handbook4 and data provided in Trip Generation5. These trips were distributed and assigned, based on the available approach and departure routes and trip distribution data from other recently completed traffic studies in the area.

5. Analyze Project-Related Traffic Impacts

The project-related traffic was then superimposed on background traffic volumes. The traffic impacts of the project were assessed by analyzing the changes in peak-hour traffic volumes and changes in the levels-of-service at the study intersections. The purpose of this analysis was to identify potential operational deficiencies in the vicinity of the proposed project.

D. Description of Existing Streets and Intersection Controls

The existing lane configurations and right-of-way controls are summarized in Attachment F.

---

1 Highway Capacity Manual, Institute of Transportation Engineers, Washington, D.C., 2000
2 Trip Generation Handbook, Institute of Transportation Engineers, Washington, D.C., 1966
3 Trip Generation, Institute of Transportation Engineers, Washington, D.C., 2000
E. Existing Peak Hour Traffic Volumes

Because schools have a midday peak hour in addition to the typical morning and afternoon peak hours, the midday peak period was also counted and analyzed. The existing morning, midday and afternoon peak hour traffic volumes for the existing intersection of Kaumana Drive at Edila Street are summarized in Attachment G.

Traffic counts for the intersection of Kaumana Drive at Edila Street were performed Thursday, May 28, 2009. The number of vehicles making each movement at the intersections was recorded at 15-minute intervals. The counts include mopeds, buses, trucks and other large vehicles. No pedestrian activity was noted during the traffic counts.

As there are no intersections and only a few driveways along Edila Street between the intersection of Kaumana Drive and the proposed driveways serving the project, the peak hourly traffic volumes of the remaining intersections were calculated from the traffic volumes counted at the intersection of Kaumana Drive at Edila Street.

F. Level-of-Service Concept

"Level-of-service" is a term which denotes any of an infinite number of combinations of traffic operating conditions that may occur on a given lane or roadway when it is subjected to various traffic volumes. Level-of-service (LOS) is a qualitative measure of the effect of a number of factors which include space, speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience.

There are six levels-of-service, A through F, which relate to the driving conditions from best to worst, respectively. The characteristics of traffic operations for each level-of-service are summarized in Table 1. In general, LOS A represents free-flow conditions with no congestion. LOS F, on the other hand, represents severe congestion with stop-and-go conditions. LOS B is typically considered acceptable for peak hour conditions in urban areas.

Corresponding to each level-of-service shown in Table 1 is a volume/capacity ratio. This is the ratio of either existing or projected traffic volumes to the capacity of the intersection. Capacity is defined as the maximum number of vehicles that can be accommodated by the roadway during a specified period of time. The capacity of a particular roadway is dependent upon its physical characteristics, such as the number of lanes, the operational characteristics of the roadway (one-way, two-way, turn prohibitions, bus stops, etc.), the type of traffic using the roadway (buses, trucks, etc.) and turning movements.

Like signalized intersections, the operating conditions of intersections controlled by stop signs can be classified by a level-of-service from A to F. However, the method for determining level-of-service for unsignalized intersections is based on the use of gaps in traffic on the major street by vehicles crossing or turning through that stream. Specifically, the capacity of the controlled legs of an intersection is based on two factors: 1) the distribution of gaps in the major street traffic stream, and 2) driver judgement in selecting gaps through which to execute a desired maneuver. The criteria for level-of-service at an unsignalized intersection is therefore based on delay of each turning movement. Table 2 summarizes the definitions for level-of-service and the corresponding delay.

G. Existing Levels-of-Service

The existing levels-of-service of the intersections are summarized in Table 3. Since all the study intersections are unsignalized, only the delays and levels-of-service of the controlled movements at the study intersections are recorded. The HCM methodology does not calculate volume-to-capacity ratios for unsignalized intersections.

### Related Projects

The second component in estimating future background traffic volumes is traffic resulting from other proposed projects in the vicinity. Related projects are defined as those projects that are likely to be constructed within or adjacent to the study project and would significantly impact traffic in the study area. Related projects may be development projects or roadway improvements. No related projects were identified.

2022 background traffic projections were calculated by expanding existing traffic volumes by the appropriate growth rates and then superimposing traffic generated by related projects. The resulting 2022 background peak hour traffic projections are shown as Attachment H.

### I. Project Trip Generation

Future traffic volumes generated by a project are typically estimated using the methodology described in the Trip Generation Handbook and data provided in Trip Generation. This method uses trip generation rates to estimate the number of trips that the project will generate during the peak hours of the project and along the adjacent street.

The trip generation analysis for each phase of the project is discussed separately.

#### Phase 1 - 2011

Phase 1 is the agricultural facilities. It is understood that this consists of a barn and storage facilities only. Peak hour traffic is considered minimal.

#### Phase 2 - 2013

Phase 2 involves construction of the caretaker’s residence and dormitories. It was assumed that the caretaker’s residence would be a single-family residence. Based on trip generation data provided in Trip Generation, a single-family detached residence will generate one trip during the morning peak hour and one trip during the afternoon peak hour.

It is understood that students living in the dormitories be will be bussed between the project site and the existing school site in Hilo. Based on information provided by the Citen, there will be eight trips per day, four trips during the morning and four trips during the midday. Half of these trips will be during the peak hour. It was also assumed that the buses will be staged at the proposed site in order to assess a worse-case scenario. This means that four buses will drive students to school in the morning and then return to the campus. During the midday peak hour, these buses will be driven into Hilo to pick up the students and then return to the campus.

---

Phase 3 - 2014

Phase 3 involves construction of the high school. High school enrollment will be 197 students. Trip Generation contains trip generation data for high schools. The rates and trip generation calculations are summarized in Table 4. The trip generation rates are based on the number of students.

NOTES:

Phase 4 - 2019

Phase 4 involves construction of the elementary (K-6) and intermediate schools (7-8). There will be 167 students in the K thru 6 school and 107 students in the intermediate school. Trip Generation contains trip generation data for K-6 school and intermediate schools. The rates and trip generation calculations are summarized in Table 5. The trip generation rates are based on the number of students.

</tbody>
</table>

NOTES:

Phase 5 - 2020

Phase 5 is the construction of the gymnasium. The gymnasium will be used by Connections' students during the day. All events that will have spectators will be scheduled during off-peak traffic periods. Therefore, there is no peak hour traffic associated with the gymnasium other than the typical traffic associated with a middle or high school.

Phase 6 - 2022

Phase 6 is the pre-kindergarten facilities. There are no trip data provided for pre-kindergarten schools. Trip data for elementary schools were used. The resulting trip generation estimates are summarized in Table 6.

**NOTES:**

The project generated traffic was distributed and assigned based on the assumption that 50 percent of the traffic would approach from and depart toward the south (toward Wilier Road) and that 50 percent would approach from and depart toward the north (Hilo). This distribution assumes that project generated traffic from area areas other that Hilo would use Punaluau Street Extension and then backtrack in order to minimize travel times.

The project trip assignments are shown in Attachment I for Alternative 1, Attachment J for Alternative 2, Attachment K for Alternative 3 and Attachment L for the Preferred Alternative.

J. Background Plus Project Projections

Background plus project traffic projections were estimated by superimposing the peak hour traffic generated by the proposed project on the background (without project) peak hour traffic projections. This assumes that the peak hourly trips generated by the project coincide with the peak hour of the adjacent street. This represents a worse-case condition, as it assumes that the peak hours of all the intersection approaches and the peak hours of the study project all coincide. The resulting background plus project traffic projections are shown as Attachments M thru P.

K. Traffic Impact Analysis

The impact of the project was assessed by analyzing the changes in the levels-of-service at the study intersections.

1. The Highway Capacity Software (HCS) package was used to perform level-of-service analyses. This package uses the Highway Capacity Manual methodology.

2. As the Highway Capacity Manual defines level-of-service by delay, we have used the same definitions.

3. The 2022 lane configurations used in the level-of-service analysis are shown as Attachment C.

The results of the level-of-service analysis are summarized in Attachment R. Shown are the average vehicle delays and levels-of-service. Existing delays and levels-of-service are also shown for comparison. The conclusions of the level-of-service analysis are that all the controlled movements at the study intersections will operate at Level-of-Service A or B, which implies high levels-of-service and very good operating conditions both without and with project generated traffic.

M. Mitigation

We have used the Institute of Transportation Engineers standard that a Level-of-Service D is the minimum acceptable level-of-service and that the criteria is applicable to the overall intersection. If project generated traffic causes the level-of-service to drop below Level-of-Service D, resulting in Level-of-Service E or F, then mitigation should be provided to improve the level-of-service to Level-of-Service D or better.

Based on this criteria, no mitigation is required at the study intersections as a result of project generated traffic. All controlled traffic movements are expected to operate at Level-of-Service A or B, which are the highest levels-of-service. This implies that delays should be minimal and operation should also be good.
N. Other Traffic Related Issues

Regional Traffic Impact

It is understood that students and employees of the proposed project will travel destinations over a wide area and will use major regional roadways, such as Pualani Street Extension and Kaumana Drive. Considering the heavy traffic volumes on these roadways and relatively small number of trips that the project will generate, the proposed project will have a minimal impact on the regional transportation system, especially at locations beyond the immediate vicinity of the project.

Public Transportation

Hilo On has a bus route along Kaumana Drive. See Attachment 3. Hilo On should be contacted relative to providing a bus stop on the campus for both students and employees.

C. Summary and Conclusions

The conclusions of the traffic impact assessment are:

1. The proposed project will generate 108 inbound and 79 outbound trips during the morning peak hour, 52 inbound trips and 72 outbound trips during the midday peak hour and 31 inbound and 30 outbound trips during the afternoon peak hour.

2. Based on the results of the level-of-service, all controlled traffic movements are expected to operate at better than acceptable level-of-service and no additional mitigation measures are recommended at this time.

3. It is very likely that some families will have more than one student at the school which means that more than one student may be dropped off and picked up by one vehicle. The Institute of Transportation Engineers trip generation rates do not provide data to estimate the number of these trips. Therefore, the number of trips estimated for the total development plan is probably overestimated. There is insufficient data to quantify this overestimate.

4. The trip generation analysis, and therefore, the level-of-service analysis, is based on trip generation data provided in Trip Generation, which is the accepted standard for traffic impact studies. The data may, or may not, reflect traffic conditions in the study area. Therefore, it is recommended that traffic surveys be performed upon completion and occupancy of Phase 3, Phase 4 and Phase 6 to confirm the trip generation analysis and that the study intersections are operating as predicted. If these surveys determine that additional mitigation measures are needed, the appropriate improvements should be identified and implemented.

5. The school should develop a traffic management plan and appoint a staff member as a transportation coordinator. The objective of the traffic management plan is to promote ride sharing and use of alternative modes of transportation such as buses and carpools by students and employees.

6. The level-of-service analysis concluded that the project driveways along Edita Street will operate at acceptable levels-of-service without separate left turn lanes. However, school related vehicles turning left into the project will cause delays to through traffic along Edita Street unless separate left turn lanes are provided. To minimize the impact of project related traffic on through traffic, it is recommended that a separate left turn lane be provided for left turns from eastbound Edita Street into the Lower Campus at Road A.

7. Alternative modes of transportation within the project should be encouraged. Alternative modes of transportation for internal trips include bicycles, golf carts, etc. Adequate parking facilities for these alternative modes should be provided.

8. Hilo On should be contacted regarding the feasibility of providing bus service to and from the project.

Respectfully submitted,

PHILLIP ROWELL AND ASSOCIATES

SHPD Correspondence
February 17, 2009

Judy Mariant
Will Chee Planning & Environmental
1018 Palm Drive
Honolulu, Hawaii 96814

Dear Ms. Mariant:

SUBJECT: Chapter 6E-8 Historic Preservation Review –
Request for Comment on Various Permits Associated with the New
Construction/Establishment of the Connections New Century Public Charter School
Kaumana & Kukua 2nd Ahupua’a, South Hilo District, Island of Hawaii
TMK: (3) 2-5-006:141

Thank you for the opportunity to comment on the aforementioned project, which we received on February 3, 2009. The entire property is within the 1880-1881 lava flow. A branch of the Kaumana lava tube complex runs underneath a portion of this site; care should be taken when planning construction in this area as there are known burials within other portions of this system and there is the potential of historic properties being located within the lava tube under this property.

We determine that no historic properties will be affected by this project because:

- Intensive cultivation has altered the land
- Residential development/urbanization has altered the land
- Previous grubbing/grading has altered the land
- An accepted archaeological inventory survey (AIS) found no historic properties
- SHPD previously reviewed this project and mitigation has been completed
- Other: This parcel is entirely within the 1880-1881 lava flow.

In the event that historic resources, including human skeletal remains, cultural materials, lava tubes, and lava blisters/bubbles are identified during the construction activities, all work needs to cease in the immediate vicinity of the find, the find needs to be protected from additional disturbance, and the State Historic Preservation Division, Hawaii Island Section, needs to be contacted immediately at (808) 933-7653. If you have questions about this letter please contact Morgan Davis at (808) 933-7650.

Aloha,

Nancy A. McMahon
Nancy McMahon, Deputy SHPO/State Archaeologist
and Historic Preservation Manager
State Historic Preservation Division
MEMORANDUM

TO: Morris M. Atta, Land Division
    P.O. Box 621
    Honolulu, Hawai‘i 96809

FROM: Pua Ai, Administrator

SUBJECT: Chapter 6E-7 and 6E-8 Historic Preservation Review –
    Draft Environmental Assessment, Connections New Century Public Charter School
    Pūnahawai Ahupu‘a, South Hilo District, Island of Hawai‘i
    TMK: (3) 2-2-06: 141

Log No. 2009.3291
Doc No. 0909TD24

Thank you for requesting our comments regarding the subject DEA, which was received in our office
August 17, 2009. The proposed project involves the construction of a new public charter school campus
effectively 72 acres on state-owned land. The campus is divided into two sections
(upper and lower) by the existing Edita Street.

Our office has previously commented on this project in a February 17, 2009 letter to Judy Marian of Will
Chee Planning (Log 2009.0099, Doc 0902MD23). In this correspondence, we indicated that there were no
known historic properties within the project area, but that a branch of the Kūmane lava tube complex
runs beneath a portion of the project area and that, “...there is the potential of historic properties being
located within the lava tube under this property.” We recommended that care be taken when planning
construction in the area overlying the lava tube. The plans presented in the EA indicate that several
building may be directly over or very close to the cave. Information provided in Dr. Stone’s testimony
dated September 4, 2009, suggests that usage of the cave may have begun shortly after its formation circa
1881. If use occurred during the early twentieth century, we believe it is important to document the
nature of that use, and to ensure that if significant historic sites are present, that they be afforded
appropriate mitigation measures and/or preservation prior to the onset of construction activities that could
cause collapses.

Attached to the DEA is a report entitled Archaeological Assessment Survey of the Connections Charter
School Kūmane Property, South Hilo District, Island of Hawaii, Reeve and Cleghorn 2008). The
fieldwork described in this report found no evidence of historic properties within the project area;
however, the study did not include an examination of the portion of the Kūmane Cave that runs beneath
the upper campus area. We did not have an opportunity to review this assessment report prior to its
publication in the DEA.

We cannot make an accurate determination of project effects until after the archaeologists return to the
project area and conduct a more thorough investigation of the Kūmane Cave beneath the project area.
We are sending a letter to the consulting firm requesting additional fieldwork and revisions to the
assessment report. We also recommend that the EA be revised to include accurate information regarding
the presence/absence of historic properties within the cave. Please contact Theresa Donham at (808) 933-
7653 if you have any questions or comments.

Subject: Historic Preservation Review of the Archaeological Assessment Survey for the Connections Public Charter School Property, Kaʻūmana, South Hilo, Hawai‘i

Dear Ms. Aiu,

By this letter, Wil Chee – Planning & Environmental is hereby requesting a review of the archaeological assessment survey report and an issuance of a letter of “no effect” for the Connections Public Charter School project. Enclosed is the SHPD submittal sheet, a hardcopy of the Archaeological Assessment Survey report and a check for $50.

The original assessment report was completed in August 2008 and was appended to the Draft EA, which was distributed for public and agency review in August 2009. After the conclusion of the comment period, SHDP requested additional investigation of Kaʻūmana Cave be conducted. The field inspection was completed in June 2010 and has been appended to the original assessment report, which is enclosed in its entirety. The Kaʻūmana Cave investigation found no historic remains within the accessible portion of the cave that underlies the subject property. Further, due to concerns raised about the project, the campus plan was redesigned by relocating all major school facilities to the property’s lower parcel and limiting development in the vicinity of the cave to a lightweight elevated walkway. The investigation therefore concluded that the project should have no impact on any historic resources within the cave. A Revised Draft EA addressing the reconfigured campus plan is being distributed for review and comment.

If you have any questions, please free to contact me at 596-4688 or at cshen@wcpohawaii.com.

Regards,

Celia Shen
Planner, Wil Chee – Planning & Environmental

List of Adjacent Landowners
Memorandum

TO: BJ Leithead Todd, Planning Director
FROM: Department of Public Works

SUBJECT: SPECIAL PERMIT APPLICATION (SPP 12-000138)
Applicant: Connections New Century Public Charter School
Request: Develop a K to 12 Charter School Campus with Dorm Facilities
Tax Map Key: 2-5-06: 141

We have reviewed the subject application forwarded by your memo dated July 31, 2012 and offer the following comments for your consideration.

All development-generated runoff shall be disposed of on site and not directed toward any adjacent properties. A drainage plan may be required by the Plan Approval process (Planning Department) in accordance with Section 25-2-72(3) of the Hawaii County Code.

The subject parcel is in an area designated as Zone X on the Flood Insurance Rate Map (FIRM) by the Federal Emergency Management Agency (FEMA). Zone X is an area determined to be outside the 500-year floodplain.

All earthwork activity, including grading and grubbing, shall conform to Chapter 10, Erosion and Sedimentation Control, of the Hawaii County Code.

The Zoning Map classifies Edita Street as a collector with an existing right-of-way width of 60 feet fronting the subject parcel. Access shall conform to Chapter 22, County Streets, of the Hawaii County Code and will require a permit from the Department of Public Works.

The Traffic Division has yet to review and comment on the TIAR. However, we are amenable to the TIAR's recommendation of a separate left turn lane into the "Lower Campus" on Edita Street.

Questions may be referred to Kelly Gomes at ext. 8327.

FROM: Quirino Antonio, Jr., Manager-Chief Engineer

SUBJECT: SPECIAL PERMIT APPLICATION (SPP 12-000138) 
REQUEST: TO DEVELOP A KINDERGARTEN TO 12th GRADE CHARTER SCHOOL CAMPUS WITH DORMITORY FACILITIES, INTERGENERATIONAL PROGRAMS, SUSTAINABLE AGRICULTURE PROGRAM AND FORESTRY/CONSERVATION PROGRAM 
APPLICANT - CONNECTIONS NEW CENTURY PUBLIC CHARTER SCHOOL AND COMMUNITY BASED EDUCATION SUPPORT SERVICES 
TAX MAP KEY 2-5-006:141

August 29, 2012

We have reviewed the subject application and have the following comments and conditions.

As stated in the subject application, water is available for up to a maximum daily usage of 4,200 gallons, from an existing 8-inch waterline within Kaumana Drive fronting the proposed Upper Campus and an existing 8-inch waterline within Edita Street fronting the proposed lower campus.

The Department has no objection to the proposed application, subject to the following conditions:

1. Prior to effecting a water commitment for the subject application, the applicant must submit detailed calculations showing the estimated maximum daily potable water demand for the project, for review and approval. The calculations, prepared by a professional engineer licensed in the State of Hawai‘i, must include the estimated peak flow in gallons per minute and the total estimated maximum daily potable water demand in gallons per day.

   Based on the water usage calculations provided, the Department will determine if water can be made available and the scope of the water system improvements required.

2. The proposed type of land use will require the installation of a reduced pressure type backflow prevention assembly on private property within five (5) feet of any meter serving the project. The installation of the backflow prevention assembly must be inspected by our department before activation of water service.

3. Subject to other agencies’ requirements to construct improvements within the road right-of-way fronting the property affected by the proposed development, the applicant shall be responsible for the relocation and adjustment of the Department’s affected water system facilities, should they be necessary.

Planning Dept.
Exhibit 3
Ms. BJ Leithead Todd, Planning Director
Page 2
August 29, 2012

For your information, the existing 8-inch waterline within Edita Street is looped and therefore adequate to provide the required 2,000 gallons per minute of flow for fire protection, as per the Department’s Water System Standards for schools.

Should there be any questions, please contact Mr. Finn McCall of our Water Resources and Planning Branch at 961-8070, extension 255.

Sincerely yours,

[Signature]
Quirino Antonio, Jr., P.E.

MEMORANDUM

Date: August 2, 2012

To: BJ LEITHEAD TODD, Planning Director

From: DORA BECK, P.E., Acting Director

Subject: Special Permit Application (SPP 12-000138)

Applicant: Connections New Century Public Charter School and Community Based Education Support Services

Request: To Develop a K to 12 Charter School Campus with Dorm Facilities, Intergenerational Programs, a Sustainable Agriculture Program and a Forestry/Conservation Program

TMK: 2-5-006:141

The Solid Waste Division has reviewed the subject application and offers the following recommendations (Please note Wastewater Division’s comments will submitted separately):

DEPARTMENT COMMENTS:

( ) Wastewater Division had no comment as this area is not a sewered and there are no immediate plans for sewering of the area.

( ) Other

SOLID WASTE COMMENTS: (Contact Solid Waste Division for details.)

( ) No comments

( ) Commercial operations, State and Federal agencies, religious entities and non-profit organizations may not use transfer stations for disposal.

( ) Aggregates and any other construction/demolition waste should be responsibly reused to its fullest extent.

( ) Ample and equal room should be provided for rubbish and recycling.

( ) Green waste may be transported to the green waste sites located at the Kailua and Hilo transfer stations, or other suitable diversion programs.

( ) Construction and demolition waste is prohibited at all County Transfer Stations.

( ) Submit Solid Waste Management Plan in accordance with attached guidelines.

( ) Existing Solid Waste Management Plan is to be followed. Provide update to the department on current status.

( ) Other:

County of Hawai‘i is an Equal Opportunity Provider and Employer.
MEMORANDUM

Date: August 2, 2012

To: BJ LEITHEAD TODD, Planning Director

From: DORA BECK, P.E., Acting Director

Subject: Special Permit Application (SPP 12-000138)
Applicant: Connections New Century Public Charter School and Community Based Education Support Services
Request: To Develop a K to 12 Charter School Campus with Dorm Facilities, Intergenerational Programs, a Sustainable Agriculture Program and a Forestry/Conservation Program

The Wastewater Division has reviewed the subject application and offers the following recommendations (please note Solid Waste Division comments will be submitted separately):

DEPARTMENT COMMENTS:

WASTEWATER COMMENTS: (Contact Wastewater Division for details.)

(X) No comments

( ) Require connection of existing and/or proposed structures to the public sewer in accordance with Section 21-5 of the Hawai‘i County Code.

( ) Require Council Resolution to approve sewer extension in accordance with Section 21-26.1 of the Hawai‘i County Code. Complete Sewer Extension Application.

( ) Require extension of the sewer system to service the proposed subdivision in accordance with Section 23-85 of the Hawai‘i County Code.

( ) Check or line out as applicable: [ ] If required by the Director of the Department of Environmental Management ("Director of DEM"), [ ] applicant shall conduct a sewer study in accordance with the then applicable wastewater system design standards prior to approval to connect to the County sewer system. Applicant shall provide such sewer line or other facility improvements as the Director of DEM may reasonably require, which the sewer study may indicate are advisable for mitigation of impacts of the proposed project. Contact Wastewater Division Chief for details.

County of Hawai‘i is an Equal Opportunity Provider and Employer.
August 13, 2012

TO: BJ LEITHEAD TADD, PLANNING DIRECTOR

FROM: HENRY J. TAVARES, ASSISTANT POLICE CHIEF AREA OPERATIONS

SUBJECT: SPECIAL PERMIT APPLICATION (SPP 12-000138)
APPLICANT: CONNECTIONS CHARTER SCHOOL AND COMMUNITY BASED EDUCATION SUPPORT SERVICES
REQUEST: TO DEVELOP A K TO 12 CHARTER SCHOOL CAMPUS WITH DORM FACILITIES, INTERGENERATIONAL PROGRAMS, A SUSTAINABLE AGRICULTURE PROGRAM AND A FORESTRY/CONSERVATION PROGRAM
TAX MAP KEY: 2-5-006:141

Staff, upon reviewing the provided documents and visiting the proposed site, has some concerns regarding this project:

Although the section fronting the proposed site is wide with a paved shoulder, the section of Edita Street from Kaumana Drive leading to this site has no pavement off of the travel portion of the roadway. The shoulder in this area is grass/muddy and not desirable for pedestrian traffic. This causes pedestrian traffic to walk on the roadway.

If approved there will be an substantial increase in pedestrian traffic as a result of this project. That, combined with the lack of sidewalks in this area, will make it unsafe for pedestrian traffic.

This proposed school is being placed in a residential area that will likely effect the quality of life for residents that border this proposed site. There will be an increase in noise, crime and traffic.

Thank you for allowing us the opportunity to comment.

REQUEST: TO DEVELOP A K-TO-12 CHARTER SCHOOL CAMPUS W/  
DORM FACILITIES, INTERGENERATIONAL PROGRAMS, A  
SUSTAINABLE AGRICULTURE PROGRAM & FORESTRY/  
CONSERVATION PROGRAM  
TAX MAP KEY: 2-5-006:141

In regards to the above-mentioned Special Permit application, the following shall be in accordance:

NFPA 1, UNIFORM FIRE CODE, 2006 EDITION  
Note: NFPA 1, Hawai‘i State Fire Code with County amendments. County amendments are  
identified with a preceding “C-“ of the reference code.

Chapter 18 Fire Department Access and Water Supply

18.1 General. Fire department access and water supplies shall comply with this chapter.

For occupancies of an especially hazardous nature, or where special hazards exist in addition to  
the normal hazard of the occupancy, or where access for fire apparatus is unduly difficult, or  
areas where there is an inadequate fire flow, or inadequate fire hydrant spacing, and the AHJ may  
require additional safeguards including, but not limited to, additional fire appliance units, more  
than one type of appliance, or special systems suitable for the protection of the hazard involved.

18.1.1 Plans.

18.1.1.1 Fire Apparatus Access. Plans for fire apparatus access roads shall be submitted to the  
fire department for review and approval prior to construction.

18.1.1.2 Fire Hydrant Systems. Plans and specifications for fire hydrant systems shall be  
submitted to the fire department for review and approval prior to construction.
C-18.1.1.2.1 Fire Hydrant use and Restrictions. No unauthorized person shall use or operate any fire hydrant unless such person first secures permission or a permit from the owner or representative of the department, or company that owns or governs that water supply or system. Exception: Fire Department personnel conducting firefighting operations, hydrant testing, and/or maintenance, and the flushing and acceptance of hydrants witnessed by Fire Prevention Bureau personnel.

18.2 Fire Department Access.

18.2.1 Fire department access and fire department access roads shall be provided and maintained in accordance with Section 18.2.

18.2.2* Access to Structures or Areas.

18.2.2.1 Access Box(es). The AHJ shall have the authority to require an access box(es) to be installed in an accessible location where access to or within a structure or area is difficult because of security.

18.2.2.2 Access to Gated Subdivisions or Developments. The AHJ shall have the authority to require fire department access be provided to gated subdivisions or developments through the use of an approved device or system.

18.2.2.3 Access Maintenance. The owner or occupant of a structure or area, with required fire department access as specified in 18.2.2.1 or 18.2.2.2, shall notify the AHJ when the access is modified in a manner that could prevent fire department access.

18.2.3 Fire Department Access Roads.

18.2.3.1 Required Access.

18.2.3.1.1 Approved fire department access roads shall be provided for every facility, building, or portion of a building hereafter constructed or relocated.

18.2.3.1.2 Fire Department access roads shall consist of roadways, fire lanes, parking lots lanes, or a combination thereof.

18.2.3.1.3* When not more than two one- and two-family dwellings or private garages, carports, sheds, agricultural buildings, and detached buildings or structures 400 ft² (37 m²) or less are present, the requirements of 18.2.3.1 through 18.2.3.2.1 shall be permitted to be modified by the AHJ.
18.2.3.1.4 When fire department access roads cannot be installed due to location on property, topography, waterways, nonnegotiable grades, or other similar conditions, the AHJ shall be authorized to require additional fire protection features.

18.2.3.2 Access to Building.

18.2.3.2.1 A fire department access road shall extend to within in 50 ft (15 m) of at least one exterior door that can be opened from the outside and that provided access to the interior of the building.

18.2.3.2.1.1 When buildings are protected throughout with an approved automatic sprinkler system that is installed in accordance with NFPA 13, NFPA 13D, or NFPA 13R, the distance in 18.2.3.2.2 shall be permitted to be increased to 300 feet.

18.2.3.2.2 Fire department access roads shall be provided such that any portion of the facility or any portion of an exterior wall of the first story of the building is located not more than 150 ft (46 m) from fire department access roads as measured by an approved route around the exterior of the building or facility.

18.2.3.2.2.1 When buildings are protected throughout with an approved automatic sprinkler system that is installed in accordance with NFPA 13, NFPA 13D, or NFPA 13R, the distance in 18.2.3.2.2 shall be permitted to be increased to 450 ft (137 m).

18.2.3.3 Multiple Access Roads. More than one fire department access road shall be provided when it is determined by the AHJ that access by a single road could be impaired by vehicle congestion, condition of terrain, climatic conditions, or other factors that could limit access.

18.2.3.4 Specifications.

18.2.3.4.1 Dimensions.

C~ 18.2.3.4.1.1 FDAR shall have an unobstructed width of not less than 20ft with an approved turn around area if the FDAR exceeds 150 feet. Exception: FDAR for one and two family dwellings shall have an unobstructed width of not less than 15 feet, with an area of not less than 20 feet wide within 150 feet of the structure being protected. An approved turn around area shall be provided if the FDAR exceeds 250 feet.

C~ 18.2.3.4.1.2 FDAR shall have an unobstructed vertical clearance of not less then 13ft 6 in.

C~ 18.2.3.4.1.2.1 Vertical clearances may be increased or reduced by the AHJ, provided such increase or reduction does not impair access by the fire apparatus, and approved signs are installed and maintained indicating such approved changes.
18.2.3.4.1.2.2 Vertical clearances shall be increased when vertical clearances or widths are not adequate to accommodate fire apparatus.

C~ 18.2.3.4.2 Surface. Fire department access roads and bridges shall be designed and maintained to support the imposed loads (25 Tons) of the fire apparatus. Such FDAR and shall be comprised of an all-weather driving surface.

18.2.3.4.3 Turning Radius.

C~ 18.2.3.4.3.1 Fire department access roads shall have a minimum inside turning radius of 30 feet, and a minimum outside turning radius of 60 feet.

18.2.3.4.3.2 Turns in fire department access road shall maintain the minimum road width.

18.2.3.4.4 Dead Ends. Dead-end fire department access roads in excess of 150 ft (46 m) in length shall be provided with approved provisions for the fire apparatus to turn around.

18.2.3.4.5 Bridges.

18.2.3.4.5.1 When a bridge is required to be used as part of a fire department access road, it shall be constructed and maintained in accordance with county requirements.

18.2.3.4.5.2 The bridge shall be designed for a live load sufficient to carry the imposed loads of fire apparatus.

18.2.3.4.5.3 Vehicle load limits shall be posted at both entrances to bridges where required by the AHJ.

18.2.3.4.6 Grade.

C~ 18.2.3.4.6.1 The maximum gradient of a Fire department access road shall not exceed 12 percent for unpaved surfaces and 15 percent for paved surfaces. In areas of the FDAR where a Fire apparatus would connect to a Fire hydrant or Fire Department Connection, the maximum gradient of such area(s) shall not exceed 10 percent.

18.2.3.4.6.2* The angle of approach and departure for any means of fire department access road shall not exceed 1 ft drop in 20 ft (0.3 m drop in 6 m) or the design limitations of the fire apparatus of the fire department, and shall be subject to approval by the AHJ.
18.2.3.4.6.3 Fire department access roads connecting to roadways shall be provided with curb cuts extending at least 2 ft (0.61 m) beyond each edge of the fire lane.

18.2.3.4.7 Traffic Calming Devices. The design and use of traffic calming devices shall be approved by the AHJ.

18.2.3.5 Marking of Fire Apparatus Access Road.

18.2.3.5.1 Where required by the AHJ, approved signs or other approved notices shall be provided and maintained to identify fire department access roads or to prohibit the obstruction thereof of both.

18.2.3.5.2 A marked fire apparatus access road shall also be known as a fire lane.

18.2.4* Obstruction and Control of Fire Department Access Road.

18.2.4.1 General.

18.2.4.1.1 The required width of a fire department access road shall not be obstructed in any manner, including by the parking of vehicles.

18.2.4.1.2 Minimum required widths and clearances established under 18.2.3.4 shall be maintained at all times.

18.2.4.1.3* Facilities and structures shall be maintained in a manner that does not impair or impede accessibility for fire department operations.

18.2.4.1.4 Entrances to fire departments access roads that have been closed with gates and barriers in accordance with 18.2.4.2.1 shall not be obstructed by parked vehicles.

18.2.4.2 Closure of Accessways.

18.2.4.2.1 The AHJ shall be authorized to require the installation and maintenance of gates or other approved barricades across roads, trails, or other accessways not including public streets, alleys, or highways.

18.2.4.2.2 Where required, gates and barricades shall be secured in an approved manner.
18.2.4.2.3 Roads, trails, and other accessways that have been closed and obstructed in the manner prescribed by 18.2.4.2.1 shall not be trespassed upon or used unless authorized by the owner and the AHJ.

18.2.4.2.4 Public officers acting within their scope of duty shall be permitted to access restricted property identified in 18.2.4.2.1.

18.2.4.2.5 Locks, gates, doors, barricades, chains, enclosures, signs, tags, or seals that have been installed by the fire department or by its order or under its control shall not be removed, unlocked, destroyed, tampered with, or otherwise vandalized in any manner.

18.3 Water Supplies and Fire Hydrants

18.3.1* A water supply approved by the county, capable of supplying the required fire flow for fire protection shall be provided to all premises upon which facilities or buildings, or portions thereof, are hereafter constructed, or moved into or within the county. When any portion of the facility or building is in excess of 150 feet (45 720 mm) from a water supply on a fire apparatus access road, as measured by an approved route around the exterior of the facility or building, on-site fire hydrants and mains capable of supplying the required fire flow shall be provided when required by the AHJ. For on-site fire hydrant requirements see section 18.3.3.

EXCEPTIONS:

1. When facilities or buildings, or portions thereof, are completely protected with an approved automatic fire sprinkler system the provisions of section 18.3.1 may be modified by the AHJ.

2. When water supply requirements cannot be installed due to topography or other conditions, the AHJ may require additional fire protection as specified in section 18.3.2 as amended in the code.

3. When there are not more than two dwellings, or two private garage, carports, sheds and agricultural. Occupancies the requirements of section 18.3.1 may be modified by AHJ.

18.3.2* Where no adequate or reliable water distribution system exists, approved reservoirs, pressure tanks, elevated tanks, fire department tanker shuttles, or other approved systems capable of providing the required fire flow shall be permitted.

18.3.3* The location, number and type of fire hydrants connected to a water supply capable of delivering the required fire flow shall be provided on a fire apparatus access road on the site of the premises or both, in accordance with the appropriate county water requirements.

18.3.4 Fire Hydrants and connections to other approved water supplies shall be accessible to the fire department.
18.3.5 Private water supply systems shall be tested and maintained in accordance with NFPA 25 or county requirements as determined by the AHJ.

18.3.6 Where required by the AHJ, fire hydrants subject to vehicular damage shall be protected unless located within a public right of way.

18.3.7 The AHJ shall be notified whenever any fire hydrant is placed out of service or returned to service. Owners of private property required to have hydrants shall maintain hydrant records of approval, testing, and maintenance, in accordance with the respective county water requirements. Records shall be made available for review by the AHJ upon request.

18.3.8 Minimum water supply for buildings that do not meet the minimum County water standards:

Buildings up to 2000 square feet, shall have a minimum of 3,000 gallons of water available for Firefighting.

Buildings 2001-3000 square feet, shall have a minimum of 6,000 gallons of water available for Firefighting.

Buildings, 3001-6000 square feet, shall have a minimum of 12,000 gallons of water available for Firefighting.

Buildings, greater than 6000 square feet, shall meet the minimum County water and fire flow requirements.

Multiple story buildings shall multiply the square feet by the amount of stories when determining the minimum water supply.

Commercial buildings requiring a minimum fire flow of 2000gpm per the Department of Water standards shall double the minimum water supply reserved for firefighting.

Fire Department Connections (FDC) to alternative water supplies shall comply with 18.3.8 (1)-(6) of this code.

NOTE: In that water catchment systems are being used as a means of water supply for firefighting, such systems shall meet the following requirements:
(1) In that a single water tank is used for both domestic and firefighting water, the water for domestic use shall not be capable of being drawn from the water reserved for firefighting;
(2) Minimum pipe diameter sizes from the water supply to the Fire Department Connection (FDC) shall be as follows:
   (a) 4" for C900 PVC pipe;
   (b) 4" for C906 PE pipe;
   (c) 3" for ductile Iron;
   (d) 3' for galvanized steel.

(3) The Fire Department Connection (FDC) shall:
   (a) be made of galvanized steel;
   (b) have a gated valve with 2-1/2 inch, National Standard Thread male fitting and cap;
   (c) be located between 8 ft and 16 ft from the Fire department access. The location shall be approved by the AHJ;
   (d) not be located less than 24 inches, and no higher than 36 inches from finish grade, as measured from the center of the FDC orifice;
   (e) be secure and capable of withstanding drafting operations. Engineered stamped plans may be required;
   (f) not be located more than 150 feet of the most remote part, but not less than 20 feet, of the structure being protected;
   (g) also comply with section 13.1.3 and 18.2.3.4.6.1 of this code:

(4) Commercial buildings requiring a fire flow of 2000gpm shall be provided with a second FDC. Each FDC shall be independent of each other, with each FDC being capable of flowing 500gpm by engineered design standards. The second FDC shall be located in an area approved by the AHJ with the idea of multiple Fire apparatus' conducting drafting operations at once, in mind.

(5) Inspection and maintenance shall be in accordance to NFPA 25.

(6) The owner or lessee of the property shall be responsible for maintaining the water level, quality, and appurtenances of the system.

EXCEPTIONS TO SECTION 18.3.8:
(1) Agricultural buildings, storage sheds, and shade houses with no combustible or equipment storage.
(2) Buildings less than 800 square feet in size that meets the minimum Fire Department Access Road requirements.
(3) For one and two family dwellings, agricultural buildings, storage sheds, and detached garages 800 to 2000 square feet in size, and meets the minimum Fire Department Access Road requirements, the distance to the Fire Department Connection may be increased to 1000 feet.
(4) For one and two family dwellings, agricultural buildings, and storage sheds
greater than 2000 square feet, but less than 3000 square feet and meets the minimum Fire Department Access Road requirements, the distance to the Fire Department Connection may be increased to 500 feet.

(5) For buildings with an approved automatic sprinkler system, the minimum water supply required may be modified.

If there are any questions regarding these requirements, please contact the Fire Prevention Bureau at (808) 932-2912.

DARREN J. ROSARIO

STATE OF HAWAII
DEPARTMENT OF LAND AND NATURAL RESOURCES
LAND DIVISION
POST OFFICE BOX 621
HONOLULU, HAWAII 96809

August 28, 2012

County of Hawaii
Planning Department
Attention: Mr. Jeff Darrow
101 Pauahi Street, Suite 3
Hilo, Hawaii 96720

via email: jdarrow@co.hawaii.hi.us

Dear Mr. Darrow:

SUBJECT: Special Permit Application (SPP 12-000138), Connections New Century Public Charter School and Community Based Education Support Services, South Hilo, Hawaii; TMK: (3) 2-5-006:141

Thank you for the opportunity to review and comment on the subject matter. The Department of Land and Natural Resources' (DLNR) Land Division distributed or made available a copy of your report pertaining to the subject matter to DLNR Divisions for their review and comments.

At this time, enclosed are comments from (1) the Division of Forestry and Wildlife, and (2) the Engineering Division on the subject matter. Should you have any questions, please feel free to call Kevin Moore at 387-0426. Thank you.

Sincerely,

Russell Y. Tsuji
Land Administrator

RE: Special Permit Application (SPP 12-000138)

Dear Mr. Darrow,

I noticed in your Special Permit Application # SPP 12-000138 and accompanying plan for the Connections campus that you mentioned a Forestry/Conservation Program. I was encouraged to see that forestry and conservation is among the goals of your plan. However, I do not feel as though the information you provided is adequate to claim such a program. You discussed utilization of native forest products (logs, timber, etc.) but you did not describe planting trees, removing invasive plants, protecting rare species, protecting native wildlife and plant corridors, etc. - all of which are what sound and sustainable forestry and conservation is in Hawai`i.

I also think that if you are going to bulldoze native forest to create this school/campus, that you really should do more to implement forestry and conservation practices that can mitigate damages caused by native forest clearing.

I urge you to put more thought into your forestry and conservation program because what you provided is not sufficient to describe what that title really means. If you have any questions or would like to discuss this further, please do not hesitate to contact me at 808-587-4172 or at sheris.mann@hawaii.gov.

Thank you for the opportunity to review your Special Permit Application and Plan for this campus.

Regards,

Sheri S. Mann,
Forestry Program Manager

RE: SpPermitAppCenturyPublicCharterSchool
Hawaii, 577

() We confirm that the project site, according to the Flood Insurance Rate Map (FIRM), is located in
Flood Zone ___.

() Please take note that the project site, according to the Flood Insurance Rate Map (FIRM), is
located in Zone ___.

() Please note that the correct Flood Zone Designation for the project site according to the Flood
Insurance Rate Map (FIRM) is ___.

() Please note that the project must comply with the rules and regulations of the National Flood
Insurance Program (NFIP) presented in Title 44 of the Code of Federal Regulations (44CFR),
whenever development within a Special Flood Hazard Area is undertaken. If there are any
questions, please contact the State NFIP Coordinator, Ms. Carol Tyau-Beam, of the Department of
Land and Natural Resources, Engineering Division at (808) 587-0267.

Please be advised that 44CFR indicates the minimum standards set forth by the NFIP. Your
Community's local flood ordinance may prove to be more restrictive and thus take precedence
over the minimum NFIP standards. If there are questions regarding the local flood ordinances,
please contact the applicable County NFIP Coordinators below:

() Mr. Mario Siu Li at (808) 768-8098 or Ms. Ardis Shaw-Kim at (808) 768-8296 of the
City and County of Honolulu, Department of Planning and Permitting.

() Mr. Frank DeMarco at (808) 961-8042 of the County of Hawaii, Department of Public
Works.

() Mr. Francis Carzon at (808) 270-7771 of the County of Maui, Department of Planning.

() Ms. Wynne Ushitome at (808) 241-4890 of the County of Kauai, Department of Public
Works.

() The applicant should include water demands and infrastructure required to meet project needs.
Please note that projects within State lands requiring water service from the Honolulu Board of
Water Supply system will be required to pay water service charges, in addition to Water
Facilities Charges for transmission and daily storage.

() The applicant should provide the water demands and calculations to the Engineering Division so it
can be included in the State Water Projects Plan Update.

() Additional Comments: _______________________________________________________________

() Other: Our previous comments dated September 8, 2010, which are attached in the Special
Permit Application for the subject project, still apply.

Should you have any questions, please call Ms. Suzie S. Agraan of the Planning Branch at 587-0258.

The Wastewater Branch has no objections to the proposed project. Please ensure that the
wastewater system that is proposed for the project complies with applicable provisions of

Dispensing site locations and food preparation areas would need to meet the requirements of
Chapter 12, Food Establishment Sanitation Code. The applicant may call Ph. 933-0917 to
discuss the content of this communication.

Underground Injection Systems (Ph. 586-4258) which receive wastewater or storm runoffs from
the proposed development need to address the requirements of Chapter 23, Hawaii State
Department of Health Administrative Rules, Title 11, “Underground Injection Control.”

The applicant would need to meet the requirements of our Department of Health Air Pollution
Rules, Chapter 60.1, Title 11, State of Hawaii for fugitive dust control. If there is need to discuss
these requirements, please contact our Clean Air Branch staff at Ph. 933-0401.

The Department of Health (DOH), Clean Water Branch (CWB), acknowledges receipt of the
subject document on August 2, 2012. The CWB has reviewed the limited information contained
in the subject document and offers the following comments:

Planning Dept.
Exhibit 8
1. The Army Corps of Engineers should be contacted at (808) 438-9258 for this project. Pursuant to Federal Water Pollution Control Act (commonly known as the "Clean Water Act" (CWA)), Paragraph 401(a)(1), a Section 401 Water Quality Certification (WQC) is required for "[a]ny applicant for Federal license or permit to conduct any activity including, but not limited to, the construction or operation of facilities, which may result in any discharge into the navigable waters...". The term "discharge" is defined in CWA, Subsections 502(16), 502(12), and 502(6); Title 40, Code of Federal Regulations, Section 122.2, and Hawaii Administrative Rules (HAR), Chapter 11-54.

2. In accordance with HAR, Sections 11-55-04 and 11-55-34.05, the Director of Health may require the submittal of an individual permit application or a Notice of Intent (NOI) for general permit coverage authorized under the National Pollutant Discharge Elimination System (NPDES).

   a. An application for an NPDES individual permit is to be submitted at least 180 days before the commencement of the respective activities. The NPDES application forms may also be picked up at our office or downloaded from our website at: http://www.hawaii.gov/health/environmental/water/cleanwater/forms/individu.htm

   b. An NOI to be covered by an NPDES general permit is to be submitted at least 30 days before the commencement of the respective activity. A separate NOI is needed for coverage under each NPDES general permit. The NOI forms may be picked up at our office or downloaded from our website at: http://www.hawaii.gov/health/environmental/water/cleanwater/forms/genl-

i. Storm water associated with industrial activities, as defined in Title 40, Code of Federal Regulations, Sections 122.26(b)(14)(i) through 122.26(b)(14)(ix) and 122.26(b)(14)(xi). [HAR, Chapter 11-55, Appendix B]

ii. Construction activities, including clearing, grading, and excavation, that result in the disturbance of equal to or greater than one (1) acre of total land area. The total land area includes a contiguous area where multiple separate and distinct construction activities may be taking place at different times or on different schedules under a larger common plan of development or sale. An NPDES permit is required before the commencement of the construction activities. [HAR, Chapter 11-55, Appendix C]

iii. Discharges of treated effluent from leaking underground storage tank remedial activities. [HAR, Chapter 11-55, Appendix D]

iv. Discharges of once through cooling water less than one (1) million gallons per day. [HAR, Chapter 11-55, Appendix E]
v. Discharges of hydrotesting water. [HAR, Chapter 11-55, Appendix F]

vi. Discharges of construction dewatering effluent. [HAR, Chapter 11-55, Appendix G]

vii. Discharges of treated effluent from petroleum bulk stations and terminals. [HAR, Chapter 11-55, Appendix H]

viii. Discharges of treated effluent from well drilling activities. [HAR, Chapter 11-55, Appendix I]

ix. Discharges of treated effluent from recycled water distribution systems. [HAR, Chapter 11-55, Appendix J]

x. Discharges of storm water from a small municipal separate storm sewer system. [HAR, Chapter 11-55, Appendix K]

xi. Discharges of circulation water from decorative ponds or tanks. [HAR, Chapter 11-55, Appendix L]

3. In accordance with HAR, Section 11-55-38, the applicant for an NPDES permit is required to either submit a copy of the new NOI or NPDES permit application to the State Department of Land and Natural Resources, State Historic Preservation Division (SHPD), or demonstrate to the satisfaction of the DOH that the project, activity, or site covered by the NOI or application has been or is being reviewed by SHPD. If applicable, please submit a copy of the request for review by SHPD or SHPD’s determination letter for the project.

4. Any discharges related to project construction or operation activities, with or without a Section 401 WQC or NPDES permit coverage, shall comply with the applicable State Water Quality Standards as specified in HAR, Chapter 11-54.

Hawaii Revised Statutes, Subsection 342D-50(a) requires that “[n]o person, including any public body, shall discharge any water pollutants into state waters, or cause or allow any water pollutant to enter state waters except in compliance with this chapter, rules adopted pursuant to this chapter, or a permit or variance issued by the director.”

If you have any questions, please contact Mr. Alec Wong, Supervisor of the Engineering Section, CWB, at (808) 586-4309.

Construction activities must comply with the provisions of Hawaii Administrative Rules, Chapter 11-46, “Community Noise Control.”

1. The contractor must obtain a noise permit if the noise levels from the construction activities are expected to exceed the allowable levels of the rules.

2. Construction equipment and on-site vehicles requiring an exhaust of gas or air must be equipped with mufflers.
3. The contractor must comply with the requirements pertaining to construction activities as specified in the rules and the conditions issued with the permit.

Should there be any questions on this matter, please contact the Department of Health at 933-0917.

We recommend that you review all of the Standard Comments on our website: http://hawaii.gov/health/environmental/env-planning/landuse/landuse.html. Any comments specifically applicable to this project should be adhered to.

The same website also features a Healthy Community Design Smart Growth Checklist (Checklist) created by Built Environment Working Group (BEWG) of the Hawaii State Department of Health. The BEWG recommends that state and county planning departments, developers, planners, engineers and other interested parties apply the healthy built environment principles in the Checklist whenever they plan or review new developments or redevelopments projects. We also ask you to share this list with others to increase community awareness on healthy community design.
Ref. No. P-13733

October 3, 2012

Ms. Bobby Jean Leithead Todd, Director
Planning Department
County of Hawai‘i
101 Pauahi Street, Suite 3
Hilo, Hawai‘i 96720

Attention: Mr. Jeff Darrow

Dear Ms. Leithead Todd:

Subject: Special Permit Application (SPP 12-000138)
Connections New Century Public Charter School, Kaumana Campus
Tax Map Key No. (3) 2-5-006: 141, 70.15 acres
Kaumana, Hilo, Hawai‘i

The Office of Planning (OP) has reviewed the subject application and has no objection to the proposed application, subject to the comments and recommendations in this letter.

Background

The applicant is seeking a special permit to develop a K-12 charter school campus with dormitory facilities, a sustainable agriculture program, and a forestry/conservation program on an approximately 70-acre parcel of land in Kaumana, owned by the State of Hawai‘i. In January 2011, the Board of Land and Natural Resources (BLNR) approved the applicant’s request for a general lease of the property for school purposes. On May 1, 2012, the BLNR published a notice of its intent to lease the property to Connections New Century Public Charter School (Connection PCS). The county requires a letter of authorization from the fee owner for special permit applications; the application does not include a fee owner’s letter of authorization from the Department of Land and Natural Resources (DLNR).

Development of the Kaumana Campus would allow Connections PCS to consolidate and expand its existing educational programs, which are currently housed in leased facilities at Nani Mau Gardens outside of Hilo town and the Kress Building in downtown Hilo, approximately 2.5 miles from the Kaumana parcel. Projected enrollment for the school is approximately 380 K-12 students and 25 intergenerational students. The school would have approximately 67 full-time
Ms. Bobby Jean Leithead Todd  
Page 2  
October 3, 2012

and part-time employees. The applicant plans to develop the proposed school campus and facilities in five to six phases with full buildout in 16 to 25 years.

The parcel is located within the State Agricultural District and is zoned A-1a (Agriculture, 1-acre minimum lot size) by the county. The property’s Land Study Bureau (LSB) overall master productivity rating is ‘D’, and is not classified under the Agricultural Lands of Importance to the State of Hawai‘i (ALISH) system. The property is currently vacant and unused. The parcel is designated as Low Density Urban on the county’s General Plan’s Land Use Plan Allocation Guide (LUPAG) map. The Low Density Urban designation allows for public facilities such as schools.

Pursuant to Hawai‘i Administrative Rules (HAR) §§15-15-95 and -96, and Hawai‘i Revised Statutes (HRS) §205-6, a special permit application for any property greater than 15 acres located in a State Agricultural District requires the approval of both the county planning commission and the State Land Use Commission (LUC). Special permits approved by the county planning commission that require LUC approval must be forwarded to the LUC within sixty days following the county planning commission decision. Within forty-five days after receipt of the county planning commission’s decision, the LUC shall act to approve, approve with modification, or deny the petition. The LUC may impose additional restrictions as may be necessary or appropriate in granting the approval, including the adherence to representations made by the applicant.

Assessment

The Office believes the proposal meets the guidelines in HAR §15-15-95, for determining an “unusual and reasonable use” for the purpose of granting a special permit pursuant to HRS §205-6:

1. The proposed use would not be contrary to HRS Chapters 205 and 205A, and the rules of the LUC in that: (a) the pahoehoe soils of the 1880-1881 lava flow overlying the property are unsuitable for conventional agriculture; (b) there is and has been no agricultural use of the property; and (c) the applicant proposes to incorporate a sustainable agriculture program into the school curriculum;

2. The proposed use would not adversely affect the surrounding low density residential properties provided that: (a) roadway improvements and traffic management measures are adopted to minimize the impact of increased traffic on local roads and residences in the vicinity of the school; and (b) the project’s drainage system improvements are designed, constructed, and maintained to ensure the runoff generated by the project is retained onsite and stormwater
overflow from Kaumana Cave does not adversely impact downstream receiving streams and properties;

3. The proposed use would not unreasonably burden public agencies to provide or expand public facilities and services as the applicant will be responsible for any infrastructure and utility improvements required by the project;

4. There are no unusual conditions, trends, or needs that have arisen to unconditionally justify the granting of the application. However, the suitability of the soils on the site are less than suitable for conventional agriculture, and the lands surrounding the property have been developed into low-density residential neighborhoods with urban expansion from Hilo town; and

5. The land is not high quality agricultural land and is less suited for conventional field crops and farming due to the low productivity of the soils of the overlying 1880-1881 lava flow.

Recommendations

The Office commends the applicant for its decision to redesign the campus plan in response to concerns raised in the environmental review process, such that the school facilities are consolidated on the lower site to avoid direct impacts to the Kaumana Cave system underlying the upper site. OP recommends that the applicant be required to comply with representations and recommended mitigation measures contained in the application, the Final Environmental Assessment (FEA), and supporting documents for the design, construction, and operation of the project with respect to:

1. Siting of the campus facilities is limited to the lower site as proposed in the Preferred Alternative to avoid disturbance to the Kaumana Cave system and the relatively undisturbed native vegetation on the upper site, and a 100-foot buffer from the Kaumana Cave for all structures is maintained, and the applicant complies with HRS Chapter 6D, the Hawai‘i cave protection law;

2. Proposed mitigation, as stated in the FEA, to halt all construction activity and contact the proper authorities, including DLNR, to assess any lava tube and its contents should an entrance to the Kaumana Cave system or previously unknown segments are encountered or inadvertently created during construction on the lower site;

3. Comments and recommendations from the DLNR State Historic Preservation Division regarding the proposed project;
4. Proposals for the development and maintenance of potable and non-potable water, wastewater, and drainage systems for the project;

5. Mitigation measures proposed in the FEA to be taken to avoid adverse impacts to endangered and threatened native species known to be in the area—the Hawaiian hoary bat, Hawaiian hawk, Hawaiian petrel, and Newell’s shearwater;

6. Traffic improvements and other mitigation measures recommended in the project’s Traffic Impact Analysis Report; and

7. Implementation of proposed sustainability measures to be incorporated into campus, site, and building design, construction, and operations.

Other Comments

While the applicant and landowner have the discretion to apply for a Special permit for the proposed project, the proposed school will be developed over an extended time period and will establish a permanent use and facility on land in the Agricultural District. Pursuant to HAR §15-15-95(e), the county planning commission must impose time limits on project development and the duration of a Special permit. The applicant and fee owner may wish to consider whether reclassification to the State Rural or Urban Districts may be appropriate in the future to facilitate permitting of planned facilities.

Thank you for the opportunity to review and comment on this application. Should you have any questions, please call Ruby Edwards, Land Use Division, at (808) 587-2817.

Sincerely,

Jesse K. Souki
Director

RE: SPECIAL PERMIT APPLICATION (SPP12-000138)
CONNECTIONS NEW CENTURY PUBLIC CHARTER SCHOOL
TMK(3)2-5-006:141

Dear Program Chief Inouye:

Thank you for your memorandum dated August 9, 2012 regarding the above subject application and on behalf of the Applicant, Connection New Century Public Charter School, we acknowledge that the State Department of Health (DOH) Wastewater Branch has no objection to the proposed project. The Applicant further acknowledges and appreciates you and your office providing the rules, regulations and guidelines associated with Chapter 11-62, Hawaii Administrative Rules, Wastewater Systems and will work to adhere to the guidelines during design and development of this project.

In addition your memorandum also notes that the applicant would need to meet the requirements of the Department of Health Air Pollution Rules, Chapter 60.1, Title 11, State of Hawaii fugitive dust control. Again, we appreciate you providing the regulations and a contact number should we have any questions related to the Air Pollution Rules.

Your memorandum also provides the requirements and recommendations from the Clean Water Branch (CWB) and Community Noise Control. Again we acknowledge the requirements from the CWB and DOH and appreciate you providing a contact number should we have any questions related to CWB and DOH.

We look forward to working with you and the various agencies within the Department of Health during future phases and development of this project. As always, should you have any questions, please feel free to contact me or Sue Lee Loy of my office at 933-1919.

Sincerely,

Ted H.S. Hong, Esq.

Assistant Police Chief Henry J. Tavares, Area I Operations  
Police Department  
County of Hawaii  
349 Kapiolani Street  
Hilo, Hawaii 96720  

RE: SPECIAL PERMIT APPLICATION (SPP12-000138)  
CONNECTIONS NEW CENTURY PUBLIC CHARTER SCHOOL  
TMK(3)2-5-006:141  

Dear Assistant Chief Tavares:  

Thank you for your memorandum dated August 13, 2012 regarding the above subject application and your comments and concerns related to the proposed project.  

By way of background the County of Hawaii Police Department was consulted during the Environmental Assessment (EA) process and in a letter dated August 11, 2009, from the Police Department it notes that “Staff, upon reviewing the provided documents and visiting the proposed sited, does not anticipate any significant impact to traffic and/or public safety concerns related to this project.”  

In an attempt to address the issue related to pedestrian traffic the Applicant does not foresee any increase to pedestrian traffic at the project site for approximately 5-7 years. This assertion is grounded in the Applicant’s data of the construction timelines and information related to student residential location that is not anticipated to change substantially within the same time period.  

It is also prudent to note that Connections has engaged area residents at four (4) public meetings related to the project to hear concerns and address them. It is a goal of Connection to be good neighbors to surrounding residents and they have made efforts to provide contact information to the area residence so concerns related to school development and activity can be discussed and addressed directly with the schools.  

We appreciate your responsiveness to this application and should you have any questions, please feel free to contact me of Sue Lee Loy of my office at 933-1919.  

Sincerely,  

Ted H.S. Hong, Esq.

TMK(3)2-5-006:141

Dear Mr. Tsuji:

Thank you for your memorandum dated August 7, 2012 providing Sheri Mann, Forestry Program Manager comments dated August 16, 2012[2] to the above subject application and on behalf of the Applicant, Connection New Century Public Charter School, we acknowledge that the Division of Forestry and Wildlife is encouraged about a forestry/conservation program planned with the campus, however found that some of the information was not adequate to claim such a program.

It is the goal of the Applicant to provide forestry/conservation for the site and incorporate it into the overall educational offerings at the school; as such, the mauka parcel which is approximately 35 acres has been identified to emerge as the forestry/conservation area along with possible areas within the makai parcel.

The Applicant has engaged with various flora specialist and personnel from the University of Hawaii at Hilo to help develop the forestry/conservation program for the campus. Although they are in the preliminary stages of identifying individuals to assist in the development of the plan, they are eager to begin and discuss items that you have identified as key components of forestry conservation such as planting trees, removal of invasive species and protecting native plants.
Russell Y. Tsuji, Land Administrator
Sheri S. Mann, Forestry Program Manager
RE: SPECIAL PERMIT APPLICATION (SPP12-000138) TMK(3)2-5-006:141
Page 2

The Applicant has also had preliminary discussions about construction practices that should be implemented during and after construction phases that would minimize the germination of invasive species and creating "planting zones" that would serve as monitoring sites and areas where replanting and transplanting could occur. The Applicant will welcome your input and knowledge to develop a forestry conservation program and look forward to collaborating with you and your division in the future for the overall success of the project.

As always, should you have any questions, please feel free to contact me or Sue Lee Loy of my office at 933-1919 or Eric Boyd of Connections Charter School to continue input regarding a forestry conservation program.

Sincerely,

[Signature]

RE: SPECIAL PERMIT APPLICATION (SPP12-000138)  
CONNECTIONS NEW CENTURY PUBLIC CHARTER SCHOOL  
TMK(3)2-5-006:141

Dear Mr. Tsuji:

Thank you for your memorandum dated August 7, 2012 providing Engineering Division comments to the above subject application and on behalf of the Applicant, Connection New Century Public Charter School, we acknowledge that the Engineering Divisions is requesting water demands and calculation so it can be included in the State Water Projects Plan Update. As part of the Special Permit process, the Applicant anticipates preparing an engineering analysis with the water demands and calculations and other estimates to the project’s potable and non-potable water demands for the Planning Department and the Department of Water Supply. Once the analysis is developed the Applicant or its engineer’s shall provide your office with a copy of the analysis. The Applicant will also support a copy of the analysis be directed to your office to be included with the State Water Projects Plan Update.

We look forward to working with you and the various agencies within the Department of Land and Natural Resources during future phases and development of this project. As always, should you have any questions, please feel free to contact me or Sue Lee Loy of my office at 933-1919.

Sincerely,

Ted H.S. Hong, Esq.

Subject: Historic Preservation Review of the Archaeological Assessment Survey and Request for Letter of “No Effect” for the Connections Public Charter School Property, Kaūmana, South Hilo, Hawai‘i

Dear Ms. Aiu,

In August of 2010, Wil Chee – Planning & Environmental (WCP) submitted to your office a request to review an archaeological assessment survey for a property located in Kaūmana, South Hilo, Hawaii ((3) 2-5-006:141). The requisite $50 fee for formal review of the document was submitted at the same time and accepted by SHPD. As part of the submittal, WCP also requested that a letter of “no effect” be issued by your office based on the findings of the archaeological assessment survey.

The archaeological assessment survey was completed in August 2008 and appended to a Draft EA that was released for public comment in August 2009. SHPD subsequently requested that additional investigation of Kaūmana Cave be conducted. This field inspection of the cave was completed in June 2010 and the field report appended to the archaeological assessment survey report. This combined archaeological assessment survey report was submitted to your office in August 2010 for review. The EA was finalized in October 2010 without any further comment received from your office.

The property is situated on land covered by the 1880-1881 Mauna Loa lava flow and no sites or features were noted during the pedestrian survey of the property. In addition, no historic remains were encountered in the accessible portion of Kaūmana Cave that underlies the property. The assessment therefore concluded that the project should have no impact on archaeological or historic resources.

It has been over 2 years since the archaeological assessment survey was submitted to your office for review, well past the 30-day mandated review period. Since we have not received a response to our request for a letter of “no effect,” we will presume you have no comment and that the proposed project will have no effect on historic properties.

If you have any questions, please free to contact me at 596-4688 or at cshen@wcphawaii.com.

Sincerely,

Celia Shen, Planner

The Honorable Bobby Jean Leithead-Todd, Director  
County of Hawaii Planning Department  
101 Pauahi Street, Suite 3  
Hilo, Hawaii 96720

Subject: Connections New Century Public Charter School Special Permit Application and Processing, Ponohawai, Kukuau, 2nd, South Hilo, Hawaii  
Tax Map Key: 3rd/2-5-06:141.

Dear Ms. Leithead-Todd:

On May 1, 2012, pursuant to Section 171-16(c), Hawaii Revised Statutes, the Board of Land and Natural Resources gave notice of its intent to lease 70.150 acres of State land situate at Ponohawai, Kukuau 2nd, South Hilo, Hawaii and identified at Tax Map Key: (3)2-5-006:141 to Connections New Century Public Charter School (“Lessee”). The request for the direct lease of State lands shall allow the Lessee to utilize said parcel for its school.

The pending direct lease is currently being drafted by the State Attorney General’s Office. At its own costs and expense, Connections is allowed to continue with the processing of a Special Permit Application that will enable the Lessee to utilize the State parcel for its school.

Should you have any questions, please feel free to call our Hawaii District Land Office at (808) 961-9590.

Sincerely,

Gordon C. Heit  
District Land Agent
